OLD TOBACCO PIPES IN GARDENS. — In the article on Huntercombe Manor, which appeared on p. 353 in the issue for November 22, the writer makes reference to the finding of some old tobacco pipes during alterations. This fact interested me, because I have found on several occasions pipes similar to those described, when making fresh excavations, such as sites for fruit trees or Rose beds. In this garden they are usually found about eighteen inches to two feet deep. The bowls of some are broken, others are in a good state of preservation, such as one I recently unearthed while making a new Rose bed. It would be interesting to know how they got there—seeing the ground (in our case) has not been disturbed to such depths for many years—in fact, we have no reason for supposing the ground has been cultivated to the depths above mentioned ever before, for previous to becoming a garden it was a country meadow, and that would carry its history back very many years. In making these remarks I have assumed that the writer of the article referred to meant a kind of clay pipe, for such have been those found by us, with stems about half an inch to two inches long, and long, narrow bowls. My employer has the pipes still in his possession. *C. Turner, Ken View Garden, Highgate.*

SELBORNE NESTING BOXES.—Last year the Press gave very material help to our work by spreading the suggestion that the nesting boxes for birds, from the sale of which the Brent Valley Bird Sanctuary derives considerable benefit, form suitable Christmas presents. The letters which we are receiving show that bird-lovers are still of the same opinion, but there must be some to whom the idea has not been presented, and I trust that by your kind aid the matter may be brought under their notice. *Wilfred Mark Webb, 42, Bloomsbury Square, W.C.*

SOLANUM JASMINOIDES.—I am enclosing a photograph (not reproduced—EDS.) of Solanum jasminoides taken on November 21 last. The plants were very small when they were put out into their present positions in the spring of 1912. For four months this season they have presented a perfect picture. The only protection they need is a little bracken around the base of the plant during severe weather. We have the Solanum planted along the whole line of a Crimson Rambler hedge, fifty yards long, and it makes a fine show when the Roses are over. *W. H. Bailey, Burwood House Gardens, Cobham, Surrey.*

SILVER-LEAF DISEASE.—Mr. Wm. Taylor's article on p. 385 reminds me of two old Nectarine trees, which were growing against a wall in a lean-to Peach house in the year 1910. They were infested with Silver-Leaf disease, and must have been unhealthy for several years, as I was given to understand they had not carried any good fruits for a long time; but I cannot speak about sulphate of iron, as I have never used it. In the last week in May I thoroughly limed the border and watered it well in, as the soil was of a very light nature. Then I applied soot water to the roots of the trees, besides syringing the trees with clear soot water every morning and soft water in the afternoons. Those two trees, to my surprise, made splendid growths of a very dark green colour, and in the autumn I covered the border with farmyard manure. In the spring of 1911 I again syringed the trees with soot water, as I did the previous year, and in that summer they carried 200 fruits and still made excellent growths, not only at the top of the trees, but all over alike. I think they had been starved for some time, as they quickly responded to this treatment and became healthy. In the autumn of last year I applied lime to some very old Plum trees growing against a garden wall, and this past spring I applied soot water to the roots but did not syringe the trees; they carried an abundance of good fruits this summer and autumn and made excellent growths of a dark green colour, and are now well set with fruit buds. These cases go to show the great value of soot. *I. Johnson, Catton House Gardens, Norwich.*

LILIUM HENRYI. — In your issue of the 6th inst. Herr Willy Müller, quoting an article of mine as his authority, puts bulbils into the leaf axils of this Lily, and asks if any of your readers have noticed them there. I am sorry to be a broken reed to your correspondent, but if he will turn to the article again he will see that L. Henryi is included in a list of Lilies some of which produce axillary bulbils and some offsets. At the time the article was written it did not seem necessary to take up your space in an enumeration of the various species which reproduce themselves in one or other or both of the two ways referred to, because well marked peculiarities of this nature come to the grower of Lilies very early in life, if not indeed at his mother's breast. In point of fact, it seems undoubtedly the case that under certain circumstances all Lilies will produce axillary bulbils. Your correspondent's experience as to the simplicity of raising L. Henryi from seed must surely be that of anyone who has tried it. The difficulty is to know what to do with the resulting myriads of bulbs of this and other easily-grown Lilies when they reach maturity, for in a small garden they cumber the ground required for more precious things. *A. Grove.*

CHRYSANTHEMUMS AND HAY FEVER.—I am pleased to read the replies from *Grower* and Mr. Mayne. Since I asked the question I have met with several others who have experienced the same trouble. I am aware, as *Grower* states, that where there is much mildew or where sulphur has been used to combat mildew, one, or both combined, may cause sneezing, but this is quite different from hay fever. My plants this year have been exceptionally free from mildew, and sulphur has not once been used. Moreover, the first severe symptoms occurred at a Chrysanthemum show, where single varieties were extensively exhibited. The effects were felt for a day or two afterwards, and re-occurred when single Chrysanthemums were used. *L.*

THE ABNORMAL SEASON.—The weather for the past three months has been exceptionally mild in the west on the warm slopes of the hills. Plants are growing and flowering in these gardens almost as well as in spring-time. Varieties of Narcissi, which usually flower here in March, are already in bloom. Other spring and summer-flowering plants now in bloom include Alyssum saxatile, Arabis alpina, Aubrietia, Cheiranthus alpinus, Daisy (Bellis perennis), Polyanthus, Pansies, Pentstemons, Veronicas, Hepatica, Scabiosa caucasica, Gazania splendens, and Iberis sempervirens, whilst in the kitchen garden Royal Sovereign and other strawberries have produced a full crop of flower trusses which have been removed. Raspberries have flowered late, and they have borne ripe fruit on canes of the current year. Seventy-five per cent. of a plot of 250 Flower of Spring Cabbages planted the middle of September and intended for use early in spring are ready for cutting. The plants are ready in ordinary seasons the first week in April. We shall have to depend on plants put out at the end of October for use in April, and I think they will be quite forward enough to take the place of the others. *Owen Moring, The Old House Gardens, Freshford, Somerset.*

GARDENERS AND LOW WAGES. — I was pleased to read the letter from *A. M., Surrey*, on this subject. I can vouch for the truth of his statements with regard to hours and wages. What other profession is there that is paid such a miserable rate? We are aware that there is the B.G.A. to back us up, but what is one to do when in last week's advertising columns of the gardening Press we find it stated "Members of B.G.A. need not apply"? Why not, may I ask? Surely members of that association are fully qualified; but no, the answer is, keep them down. Now fellow workers, cannot we band together and fight for our just cause? If things are to go on as they are at present then we must blame ourselves. *L.*

STATICE PROFUSA. — I was much interested in the account of winter-flowering plants at Ascott, Leighton Buzzard, on p. 413, and especially to know that Mr. Jennings grows the old Statice profusa, which I think, with its lovely shade of blue, is one of the most attractive plants at this season of the year. When visiting the gardens at Chatsworth last September, which are managed so splendidly by Mr. Jennings' son, I there saw specimens grown in perfection as decorative plants. Arranged in one of the long corridors of Chatsworth House, the effect was gorgeous. I remember the plant for more than thirty years, yet at the present time it does not appear purchasable. I wonder some of the nurserymen do not list it, for its merits are so good. *W. H. Bailey.*

CONFERENCE ON SAXIFRAGES.—I should indeed be sorry if, as Mr. Milne-Redhead alleges in his note on the proposed Saxifrage Conference on p. 425, I had misrepresented the facts of the case. It was perhaps owing to a desire to compress my letter within reasonable limits that I failed to make my meaning clear. If the Conference is to arrive at any definite conclusions, it is essential that there should be available at the time copies of the original descriptions of all the plants which botanists have described under specific names. Many of these descriptions are doubtless in rare or not easily accessible publications, to which it would be impossible to refer during the course of the Conference. Copies must be made in advance, and it is a long and tedious undertaking. To my mind, the only way to make such a Conference of real value would be to call a preliminary meeting at once and endeavour to arrange that

different people should set to work systematically to collect all available information on the various sections of the family. If the names of those who had undertaken to work at the various sections were announced, they would doubtless receive much valuable information from scattered sources. Their preliminary results as to synonymy and classification might be circulated among those interested, who would then meet at the actual Conference prepared to discuss, confirm, or refute the tentative results of the preliminary enquiries. So far as I know, no such steps have yet been taken, and a Conference, which merely consists of the reading of papers with no opportunity of checking the results contained in them, must necessarily be inconclusive. *W. R. Dykes.*

HEAVY YIELD OF POTATOS.—My gardener has this week dug from my garden a single root of Potatos (self sown) which yielded seven tubers weighing 2 lbs. 1 oz., 1 lb. 15 ozs., 1 lb. 9 ozs., 1 lb., 8½ ozs., 8 ozs., and 4 ozs. respectively, the total weight being 7 lbs. 13½ ozs. Is this or is it not a very extraordinary yield? I am not an authority upon Potato-growing, and should value your opinion. *Malcolm W. Keith, Dunottar, Warlingham.* [The yield is a good one but not a record. At the National Potato Society's Exhibition in 1905, twelve tubers of Scottish Triumph produced 147 lbs., an average of 12¼ lbs. per set.—EDS.]

CERCOSPORA VIOLÆ.—A few remarks concerning the disastrous results which I have experienced in the cultivation of the Violet during the past three seasons through bad attacks of the Violet disease (Cercospora violæ) may be of interest to readers. I have burnt the entire stock each season, procured fresh and healthy plants from various localities several miles distant, and replanted them in different parts of the garden where Violets had not been cultivated for several years. Some have been grown in the open garden in full sunshine, others under a north wall, and still others under fruit trees. During the summer the ground has been hoed frequently, well watered in dry weather, dusted well with wood-ash and soot, and syringed frequently with paraffin and soft-soap emulsion, and other specifics. Before lifting the plants, which I do about the second week in September, the frames have been thoroughly cleansed and removed to a fresh site. The soil was procured from an old pasture, plenty of charcoal and mortar rubble being incorporated with it; it was placed firmly in the frames to within a few inches of the glass. The plants were lifted with good balls of soil, and planted firmly. The lights were removed during favourable weather, and notwithstanding careful picking of affected leaves the disease spread rapidly each year about the end of November, the flower buds failing to open, scarcely a healthy leaf being left on the plants. This year I dusted the plants well with powdered charcoal whilst they were in the frames, and also watered and syringed them with a weak solution of permanganate of potash. They appeared healthy, and promised well until the end of November, but during the past two weeks the disease has developed rapidly, and now scarcely a healthy leaf remains. I have never seen such bad cases of the disease before. *Edward Spinks, Garston House Gardens, Watford.* [Try the effect of spraying liver of sulphur, ½ oz. in 2 gallons water, and of dusting flowers of sulphur between the plants.—EDS.]

TRIAL OF DAHLIAS.—Under the heading of the "Pæony-Flowered Type," in your notice of the trial of Dahlias held at Duffryn, Cardiff, you give an extensive list of varieties, with the raiser's name, amongst which we notice are a number of our raising and introduction which you attribute to other growers. This, we feel sure, you will realise is scarcely fair, and are confident that having drawn your attention to same, you will take steps to rectify this. The varieties are Codsall Gem, Mrs. J. Chamberlain, Mrs. Kerr, Mrs. T. G. Baker, Sunset, Viscountess Newport, and Warrior. *Baker's, Wolverhampton.* [The list was official and supplied us by the Secretary of the R.H.S.—EDS.]

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 16.—The Floral and Orchid Committees of this Society met on Tuesday last at the Vincent Square Hall, but there was no display other than that provided by the plants submitted for Certificate. The object of holding such meetings at a time when a general display is considered inappropriate is to provide means for inspecting novelties that cannot be expected to last in flower until the first meeting in January, which this season will not be until January 13.

The plants were all grouped in the library on this occasion, and the meetings of the Floral and Orchid Committees were held in succession at the large table where the Scientific Committee usually meets in the afternoon; the Floral Committee sat first, probably because it is the older body.

Floral Committee.

Present: H. B. May, Esq., in the chair, and Messrs. W. Bain, E. H. Jenkins, John Dickson, J. Jennings, W. Howe, Thomas Stevenson, W. J. James, R. Hooper Pearson, J. Moorman, Geo. Reuthe, J. F. McLeod, C. R. Fielder, W. P. Thompson, George Gordon, E. A. Bowles, and J. Green.

AWARDS OF MERIT

were recommended to the two novelties described below:—

Carnation Philadelphia.—A reddish-pink flower of the American type, with fringed florets. Shown by Messrs. W. WELLS.

Chrysanthemum Bertha Lachaux.—A large reflexed flower with full centre, the florets having an appearance of smoothness, but the form lacking refinement. The colour is pale mauve. Shown by Messrs. WELLS.

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the chair, and Messrs. Jas. O'Brien (hon. secretary), Gurney Wilson, W. Bolton, A. McBean, W. H. Hatcher, S. W. Flory, H. G. Alexander, T. Armstrong, A. Dye, De B. Crawshay, Stuart Low, R. A. Rolfe, J. Charlesworth, R. G. Thwaites, W. Cobb, W. H. White, F. J. Hanbury, J. E. Shill and Sir Harry J. Veitch.

The centre of attraction was the beautiful white Cattleya Percivaliana alba Lady Holford, shown by Lieut.-Col. Sir GEO. L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander) (see Awards), who also showed Cypripedium Swallowtail (Mons. de Carte × Fairrieanum) and C. Troubadour (of unknown parentage).

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), sent a pan of four pretty specimens of the new scarlet Habenaria Roebelenii.

Earl STANHOPE, Chevening Park, Sevenoaks, showed four hybrid Calanthes obtained by crossing C. Veitchii and forms of C. vestita.

Baron BRUNO SCHRODER, The Dell, Englefield Green (gr. Mr. J. E. Shill), showed his fine Odontoglossum ardentissimum Ebor, which had previously secured a First-class Certificate, and which is one of the finest hybrid Odontoglossums. The plant was an excellent example of fine culture.

Messrs. CHARLESWORTH AND CO., Haywards Heath, showed Odontoglossum eximium augustum, a grand dark variety, with a spike of eighteen flowers; O. eximium xanthotes, pure white with yellow spots as in O. crispum xanthotes; Lælio-Cattleya Britannia var. Melanie (C. Warscewiczii Frau Melanie Beyrodt × L.-C. Canhamiana alba), a pretty hybrid with pure white sepals and petals and light purple lip.

Messrs. J. AND A. MCBEAN, Cooksbridge, showed their handsome Lælia anceps Schröderæ McBean's variety; a very fine Odontoglossum Doris, Sophro-Cattleya Saxa, and some brightly-coloured Odontiodas, O. Euterpe McBean's variety (O. Uro-Skinneri × C. Noezliana), being of large size and coloured carmine red.

FRED J. HANBURY, Esq., Brockhurst, East Grinstead (gr. Mr. Matthews), showed as Cypripedium Hanburyanum a hybrid said to be between C. Leeanum giganteum and C. Maudiæ, but in which none of the latter could be detected.

E. R. ASTON, Esq., Broadlands, Tunbridge Wells, showed Odontioda Royal Gem Broadlands variety, with yellowish ground colour blotched with red-brown.

Messrs. ARMSTRONG AND BROWN, Tunbridge Wells, showed Cypripedium Sandhurst (concolor Regnieri × Fairrieanum), a very pretty and distinct hybrid of good shape. Ground colour creamy-white closely lined and tinged with claret red.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Percivaliana alba "Lady Holford." A superb flower and a great advance on former white forms shown, the flowers being large, well formed, and clear white, with a deep orange colour in the tube of the lip. The plant was a fine example of cultural skill and bore four flowers.

AWARD OF MERIT.

Odontonia Langowoyi (*Miltonia Schröderiana* × *Odontoglossum Uro-Skinneri*), from Messrs. CHARLESWORTH AND CO., Haywards Heath. A very distinct and pretty hybrid in form nearest to Miltonia, and bearing an erect spike of flowers, each about two inches across. The lanceolate sepals and broader petals were chocolate purple, with the blotching as in O. Uro-Skinneri, showing in a darker tint. Lip purple at the base, expanded in front into a broad white blade with a few rose-coloured spots.

Cypripedium nitens-Leeanum smaragdinum (*nitens Sallieri Hyeanum* × *Leeanum giganteum*), from F. J. HANBURY, Esq., Brockhurst (gr. Mr. Matthews). Flowers of the character of C. aureum Surprise; emerald green with white tip to the dorsal sepal.

Odontoglossum Cleopatra (*Carmania* (*Harryanum* × *cristatellum*) × *Vuylstekei*), from DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables). A desirable and distinct novelty of good shape, size and colour. The sepals and petals are uniformly coloured light reddish-purple, with narrow primrose margin and tips. The lip, much like that of O. Harryanum, is broad, white in front, and closely marked with purple on the basal half.

Cypripedium Bourtonense (*insigne Harefield Hall* × *Blanche Moore*), from G. F. MOORE, Esq., Bourton-on-the-Water (gr. Mr. Page). A large flower with greenish ground colour, the upper half of the dorsal sepal and borders of the broad lower sepals being white. The petals and lip are tinged with purple.

NATIONAL CHRYSANTHEMUM.

CONFERENCE ON OUTDOOR CHRYSANTHEMUMS.

DECEMBER 10. — A Conference on Outdoor Chrysanthemums was held under the auspices of the National Chrysanthemum Society on the 10th inst., at the Essex Hall, Strand.

Mr. E. F. HAWES, who occupied the chair, referred with regret to the absence of the President through indisposition.

DEVELOPMENT OF THE OUTDOOR CHRYSANTHEMUM.

The first paper was by Mr. NORMAN DAVIS, and the subject was the development of the outdoor Chrysanthemum. Mr. DAVIS spoke as follows:—

I would first call attention to what many old growers must regret, viz., the neglect of the old hardy types of Chrysanthemums that, forty years ago, flowered so freely in gardens during the month of November, and often well into December. The varieties were those of the very old reflexed type, such as Cottage Pink, the Christines, and Dr. Sharp, certain of the Anemone-flowered varieties, such as Gluck and Mr. Astie, and practically all those of the Pompon class. In country districts many are still grown in cottage gardens, but in town and suburb they seem to have been discarded or to be grown only in greenhouses, much to their detriment..

After referring to circumstances in the remote history of the Chrysanthemum, Mr. DAVIS proceeded as follows:—

Notwithstanding that we continually find plants sporting from a late to an early type, there does not appear to have been any instance of an effort to perpetuate them. The history of Madame C. Desgrange, the first large early variety to create attention, is interesting, if only from the fact of its seeming unwillingness to be-

come a candidate for popularity. Madame C. Desgrange was a chance seedling, such as I have described, among a batch of late varieties. Its raiser finds no interest in it, and it passes into the hands of a French nurseryman, M. Lemoine, who appears simply to have made use of it as a gift plant—the custom of French nurserymen, at all events in those days, being to present something gratis. Hence we find it was distributed to his customers in this country. It was never listed in any of the French catalogues, and probably never grown there afterwards. Madame C. Desgrange eventually passed into the hands of Mr. Robert Parker, of Tooting, and its value was then recognised. Probably no other Chrysanthemum has been so largely cultivated in this country.

For the present race of early varieties we are indebted principally to the efforts of the late Simon Delaux, of Toulouse. In 1882 this nurseryman introduced three Japanese varieties that flowered in August. These may have been obtained by crossing with the Early Pompon section, but I consider that they were simply the result of seeding the early break bud of the ordinary Japanese variety with successive selections. These three varieties were the first introductions, and were named Mons. Pynaert van Geert, Simon Delaux, and Isidore Feral. I exhibited all three varieties, together with a trained specimen plant of Madame C. Desgrange, at the Crystal Palace Fruit Show in the autumn of 1883—the first exhibit of early varieties.

In this early venture I was joined by the late Mr. W. Piercy, whose friendship I enjoyed for many years to my profit and experience in early Chrysanthemums. Mons. Simon Delaux continued to send us other varieties, until in the year 1891 he distributed no fewer than 125 varieties, followed the next year by several more. It would be useless to recall all their names. A few that still remain or have not been discarded long are M. Gustave Grünerwald, Vice-President Hardy, Madame Eulalie Morel, and Albert Chaussin in the first set, and Wm. Holmes and Madame Marie Masse a little later.

The next introductions from the Continent of importance were those of Mons. Auguste Nonin, of Châtillon. To this noted raiser we owe such varieties as Perle Rose, Champ d'Or, Glacier, Le Pactole, Normandie, Perle Châtillonaise, Provence, Roi des Blancs, Savoie, Tapis de Neige, and others.

I will now refer to the work of raisers in this country, and no record would be complete without paying a tribute to the late Mr. W. Piercy, not to the great number of his introductions, but to the impetus he gave the growing and popularising of the flower by his voluminous writing. Of the early Pompon varieties I will only mention a few raised in this country, that, for a time, gave an impetus to the cultivation of this section. These are Mrs. Cullingford and Early Blush, both raised by Mr. W. H. Cullingford, an amateur; Blushing Bride, a seedling of my own, Piercy's Seedling, Anastasia, Alice Butcher, and Longfellow. Unfortunately these useful little flowers have passed somewhat out of favour.

Of the large-flowered section a few acquisitions by various raisers were Harvest Home (Owen), Market White and Mychett White (Russell), Queen of the Earlies (Godfrey), Lady Fitzwygram (Agate), Caledonia and Lady Mary Hope (Smellie).

Next we come to the Goacher seedlings distributed by Messrs. W. Wells and Co., and I need hardly say that these introductions were of great value, and did much to popularise this section. They have all the good points of garden varieties. Of these we still grow Goacher's Crimson, Goacher's Pink, Carrie, Lillie, Harrie, Leslie, Miss Burchfell, Polly, and Patricia.

I have left the important work of my friend Mr. H. J. Jones until last. It is thirty years since I made the acquaintance of Mr. Jones. He was then deeply interested in early Chrysanthemums, and I do not think that his interest has ever slackened. One of his first introductions was Ryecroft Glory. In Nina Blick we have one of the hardiest of Chrysanthemums; R. Pemberton, Brilliant, Joyce, Improved Masse, and Mrs. Tom White are but a few of the Ryecroft introductions.

In mentioning "Framfield Early White," one of my own recent introductions, it is with the hope that it may prove as useful as some declare it to be.

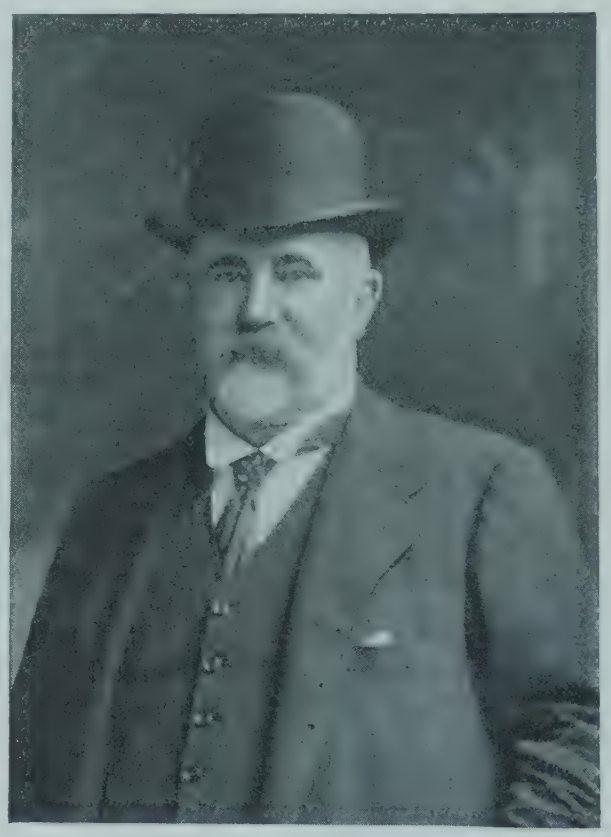
In all these introductions, together with their numerous sports, we have obtained a large and comprehensive collection. Large size is not desired in garden varieties, but we have seen a steady improvement in colour and hardiness.

To market growers we are indebted for a new race, and I think we may look forward to the advent of a later section of hardy varieties to take the place of those mentioned above. A few of these introductions have found their way into the early section, such as Dolores, Almirante, Juliet, Dorothy Ashley, all border varieties. But those I more particularly refer to are of the type of "Cranfordia" and Cranford Yellow. If we can get more of this class they will fill a void in gardens, for after all, November seems to me to be the month for Chrysanthemums rather than the months of August and September.

(*To be continued.*)

Obituary.

MARTIN JOHN SUTTON, J.P., F.L.S.— Horticulturists throughout the world will learn with regret of the death of Mr. Martin John Sutton, who was for many years head of the firm of Messrs. Sutton and Sons, Reading. It was but a few days ago that Mr. Sutton attended the Smithfield Show, and although it was known to his friends that his health was no longer robust, it was hoped that he had yet many years of active and useful life before him. He was taken ill, however, after undergoing a dental operation, and died in London on December 14.



THE LATE MARTIN JOHN SUTTON.

Born at Reading in 1850, Martin John was the eldest son of the late Mr. Martin Hope Sutton, who with his brother, Alfred, laid the foundations of the great firm. In the middle of last century most boys began the business of life at an early age, and accordingly Mr. Sutton entered on his business career when he was sixteen years old. On his coming of age in 1871 Mr. Sutton was taken into partnership by his father and uncle, and in 1887 he became the head of the firm. In this position he remained until a few years ago, when having seen the business expand to its present world-wide dimensions, and having the certainty that a younger generation was ready to carry on his work, he and his brother Arthur resigned the direction of the firm's affairs into the hands of their younger brother, Leonard, Martin John's eldest son, Martin H. Foquet Sutton, and Mr. E. P. F. Sutton. Although no longer responsible for the management and organisation of the business, Martin John continued till the end to take an active interest in, and to advise upon, the more general aspects of the work of the house of Sutton. In these days of a narrower specialisation it might well be thought that the work of a great business must monopolise all the energies of an individual; but Mr. Sutton belonged to a more robust generation. His interests were wide, and he played a conspicuous part in the agricultural, educational and religious life of the community, and also in the civic life of his native town, in much the same way as Mr. Arthur W. Sutton has devoted time to horticultural and scientific work.

The events which led to Mr. Sutton's resignation from the Council of the Royal Agricultural Society demonstrate at once his foresight and determination. Convinced that it was a mistaken policy to replace the perambulatory show of the Society by a fixed show, he resigned in order to emphasise his disapproval of the scheme for making Park Royal the permanent home of the Society's show. Shortly after its foundation Mr. Sutton became a member of the Council of the college (now University College) at Reading. To his counsel and generosity the College is deeply indebted, but perhaps the deepest debt which members of the staff owe to Mr. Sutton is the encouragement which he gave them in their efforts to bring science and practice into closer touch with one another. Not sanguine as to the immediate benefits which a young science is likely to confer on an old industry, nevertheless Mr. Sutton, like his colleagues and successors in the business, was ready always to encourage investigations, and to put the experience and resource of the great Reading establishment at their service. A quick generosity was a marked characteristic of the men, and we ourselves remember not a few examples, of which one must suffice. Some 10 or 11 years ago, when, in spite of its limited resources, the College determined to establish a horticultural department, and ordered its first stock of seeds and implements from Messrs. Sutton's, a receipted bill was returned instead of an invoice. Mr. Martin John Sutton was a frequent contributor to the Press, both on agricultural and on other subjects. His best-known volume on *Permanent and Temporary Pastures* has passed through numerous editions, and is recognised as a standard work. Mr. Sutton was Mayor of Reading in 1904, and was a freeman of the borough. He was a Knight of Grace of the Order of the Hospital of St. John of Jerusalem in England, and Chevalier of the Legion of Honour. His generosity to the town of Reading was great, and included the presentation of a fine statue of King Edward VII. A man of strong build, with pale, grave face, he seemed severe to those who had not yet discovered that the appearance of severity masked a true kindness of heart, and served to conceal from the world at large the contending qualities of determination and of modesty which, however, were not hidden from nor ignored by his friends. His work for horticulture and agriculture will endure, for like his leading contemporaries he held that the proper conduct of a seedsman's business consists in the rejection from commerce of all but the best.

The funeral took place at Sonning on Wednesday last, and a memorial service was held on the same day at Greyfriars Church, Reading, the memorial service being attended by the Deputy Mayor and Corporation of Reading, and representatives of the numerous societies with which Mr. Sutton was associated.

JOHN PEARSON.—Mr. John Pearson, gardener at Beechwood, Murrayfield, Midlothian, died there on the 10th inst., aged 70 years.

GEORGE DAVID CLARK.—An inquest was held at Dover on the 16th inst. concerning the death of Mr. G. D. Clark, a market gardener, living in Buckland Avenue, but having gardens towards Watersend and elsewhere, who died as the result of injuries caused by a gas explosion occurring at his house early on the 12th inst. Much sympathy was expressed for his widow and family. He was well known in the trade, but must not be confused with Mr. George Clark, the famous florist of Dover.

MARKETS.

COVENT GARDEN, December 17.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Cut Foliage, &c.: Average Wholesale Prices.

REMARKS.—Trade has improved, and during the next few days we may expect a busy time. A fair amount of flowers has been despatched to the provinces this week. White Chrysanthemums in bunches appear to be more plentiful than coloured blooms. Prices for those of best quality have advanced, especially for good yellow and bronze varieties. Carnations are a little more plentiful, except scarlet varieties, which are a very short supply. The price for Arum is higher than for Liliums. Supplies of Camellias, Roman Hyacinths, Lily-of-the-Valley, and Daffodils are, so far, sufficient for the demand. Gardenias are becoming very scarce, and are consequently dear. Roses such as Madame Abel Chatenay, Richmond, and a few blooms of Liberty are arriving in a good condition, and their prices are a trifle firmer, especially for those with long stems. Freesias continue to sell well. Bunch Tulips and Tulips on the bulbs are fresh subjects this week, and these should find a ready sale for the Christmas and New Year's trade. Larger consignments of flowers are arriving from France, and the quality generally is good. Single Violets are at their best condition. For these, also Anemones and Ranunculus, there should be plenty of business in the foreign flower market.

REMARKS.—The salesmen have disposed of large numbers of plants this week, and good business is expected to continue. Erica hyemalis, Solanum capsicastrum, Cyclamens, Poinsettias, Marguerites, and Azaleas are the chief flowering plants on sale. The trade in Palms and Ferns is also very good, and large consignments of these plants are being despatched to the provinces. Prices for flowering plants are firmer.

REMARKS.—English dessert Apples are now limited to a few fruits of Cox's Orange Pippin. Of cooking varieties the chief are Dumelow's Seedling, (Wellington) Newton Wonder, and Bramley's Seedling. Apples from Nova Scotia to hand this week arrived in an excellent condition, the bulk being packed in barrels. There are also large consignments of Apples from the United States and Canada. California is sending large supplies of boxed fruits, Pears and seedless Oranges. Supplies of black Grapes from English and Belgian growers are well maintained, but English Muscats are a decreasing supply. English Tomatos are still available in limited quantities. Fewer Tomatos have been received from the Canary Islands this week. Nuts are a shortage from all sources, with the exception of Naples Chestnuts. Forced vegetables include Asparagus, English and French Beans, Peas, Potatos, Seakale, Cucumbers, and Mushrooms. Salads are available in fairly large quantities for the season of the year. Rhubarb from Yorkshire is an increasing quantity daily. The commoner vegetables are all still very plentiful.—*E. H. R., Covent Garden, December 17, 1913.*

REMARKS.—Trade is only good for best quality tubers; others are very cheap and sell with difficulty. Stocks in London are very heavy, and the growers are sending large consignments. *E. J. Newborn, Covent Garden and St. Pancras, December 18, 1913.*

THE WEATHER.

GENERAL REMARKS.

December 16, 1913.

Weather.—The general conditions were dry over England, although the sky was usually cloudy or overcast. In the north and west of Scotland rain was frequent, and in Ireland and the western portions of Great Britain there were few days without a measurable quantity.

Temperature was low in Scotland at the beginning of the week, but soon rose rapidly, so that the mean for the week was in excess of the normal over the entire Kingdom, the greatest difference being 6° in the Midland Counties. The highest of the maxima were recorded on the 8th or 9th, and ranged from 59° in Scotland East to 54° in England South-West. The lowest of the minima, which occurred on the 7th in the north and east of Great Britain, and the 13th elsewhere, varied from 5° in Scotland East (at Balmoral), 17° in Scotland North, and 20° in England North-East to 35° in England South-West, and to 44° in the English Channel. The lowest grass readings were 3° at Balmoral, 14° at West Witton, 15° at Crathes, 17° at Durham, and 19° at Marchmont and Newton Rigg. Over the Kingdom generally the temperature of the soil was still above the average both at a depth of 1 foot and 4 feet.

Mean Temperature of the Sea was again above the normal on almost all parts of the coast, the mean for the week ranging from 53° at Plymouth, 52° at Newquay, and about 50° at Scilly, Cleggan, and Seafield to 43° at Kirkwall, Cromarty and Scarborough. At nearly all the stations the water was warmer than in the corresponding week of last year.

Rainfall was less than the average in all districts. Over the eastern half of England the fall was less than 0.05 inch, and at several stations the week was rainless.

Bright Sunshine was below the normal except in Scotland East. The percentage of the possible duration in that district was 18, but in Scotland West and Ireland North it was only 8, and in Scotland North only 4. Over the major portion of the Kingdom the daily mean was less than 1 hour, and in Scotland North only 0.3 hour.

Barometer and Wind.—At the commencement of the week a high pressure ridge extended from the Bay of Biscay region to beyond the north of Scotland, the wind being moderate from the westward in Ireland, but light and variable over Great Britain. By Monday, however, the high pressure had retreated to the Continent and the wind had become south-westerly or southerly over these islands, and the force increased. From this time onward the barometer was highest to the southward or south-westward of this country, while the centres of large depressions travelled eastward from Iceland to northern Europe. The main wind direction consequently became westerly, and its force varied from a light to fresh breeze in the south to a strong breeze or a high wind in the north-west and north. In Scotland, the north of England, and the north of Ireland the force of a gale was experienced at times.

THE WEATHER IN WEST HERTS.

Week ending December 17, 1913.

Another Unseasonably Warm Week, and the Thirteenth in succession.—This was another warm week, and the thirteenth of the series. During the last ten days there has not been a single unseasonably cold day, nor a single unseasonably cold night. The ground is at the present time 3° warmer than is seasonable, both at 1ft. and 2ft. deep. No measurable quantity of rain fell during the week, and less than ½in. since the beginning of the month. There has been no measurable percolation through either of the soil-gauges during the past four days. The sun shone on an average for two hours, six minutes a day, which is nearly an hour a day longer than is usual at the same period in December. On one day (the 13th inst.) the sun was shining brightly for 5¾ hours—or, with two exceptions, for a longer time than in any December day for fifteen years. The winds were as a rule of moderate strength, and came exclusively from some westerly point of the compass. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 4 per cent. *E. M., Berkhamsted, December 17, 1913.*

GARDENING APPOINTMENTS.

Mr. T. Howden, for the past 8 years Gardener at Denton Court, Canterbury, as Gardener to A. DU CROS, Esq., M.P., Craigweil House, Aldwick, Bognor, Sussex. [Thanks for 1s. for R.G.O.F. box.—EDS.]

Mr. H. B. Johns, previously with E. CRAIG, Esq., M.P., Alsager, Cheshire, as Gardener at Primley Hill, Paignton, S. Devon.

REPLY.

PRIMULA MALACOIDES AND SKIN IRRITATION.—In answer to the enquiry by *W. F.*, p. 432, Primula malacoides does cause irritation of the skin. I have been affected by the plant for a month at a time, whilst a friend of mine has suffered similarly for six weeks. The irritation is worst at night, and may continue till the morning. The trouble starts from the fingers and runs down to the toes. Thin gloves should always be worn when handling this Primula. *John E. Stott.*

Answers to Correspondents

ARTIFICIALS FOR GRAVELLY SOIL: *W. J. F.* In view of your soil being gravelly, artificial manures are not the most economical fertilisers to employ, unless the ground contains a good basis of farmyard manure, in which case the humus would retain some of the manurial properties of the fertilisers. A dressing of basic slag may be applied now. Quick-acting manures, such as nitrate of soda, may be applied in small quantities at intervals, and only in the spring, for they would be washed away in the drainage water now.

BOWLING GREEN: *T. D.* A full-sized bowling-green is 40 yards square, which gives six rinks of 20 feet each, and players are enabled to play across and transversely, allowing the ends at which most wear and tear occurs a rest, say, every alternate week, and so keep it in good condition If there is not enough space for a full-sized bowling-green, a smaller, say, three, two, or only one-rink green may be made. Each rink should be 20 feet in width and 40 yards long, but if there is only to be one rink it is advisable to allow 2 or 3 feet over at each side, especially if bowls of larger bias than three degrees are played with. In our issues of January 18 and 25, 1913, you will find full details for the making of bowling greens.

CHRYSANTHEMUMS FOR MARKETING: *F. S.* The following list of Chrysanthemums includes varieties that will furnish a supply of cut blooms for marketing from early in September to well into the New Year:—September and October (*white*): Roi des Blancs, White Countess, Framfield Early, Madame Desgrange, Cranford White, Quintus (excellent for sprays); (*yellow*) Carrie, Madame Desgrange, Sunshine, Ryecroft Glory, Cranford Yellow, Soleil d'Octobre (October and November); (*pink*) Betty Spark, Cranford Pink; (*red*) Goacher's Crimson, Crimson Polly. November and December (*white*): Souvenir Petite Amie, Mrs. Roots, Moneymaker, Mrs. J. Thompson, Heston White; (*yellow*) Bonnie Dundee, Emblème Poitevine, Golden Age, December Gold; (*pink*) Framfield Pink, Winter Cheer; (*red*) Market Red; (*bronze*) Octobre, Nina Blick, Sydney Peto, and Heston Bronze. The varieties mentioned under the side heading of September and October are suitable for flowering out-of-doors, though in some seasons it may be necessary to protect the flowers of Soleil and Bronze d'Octobre and Cranford Pink from the effects of frost with canvas, while the varieties named under the side heading of November and December are for transplanting under glass in October. The varieties flower in the order in which their names appear.—The *Horticultural Trade Journal* is printed and published by the Horticultural Printing Co. at the Horticultural Printing Works, Burnley, Lancashire.

LAWN: *Lignum.* If your soil is naturally well drained there is no value in retaining the layer of ashes, but if the ground is heavy and likely to be excessively damp in winter the ashes may be allowed to remain. The depth of soil spread over the ashes need not exceed 6 inches, provided you have means of watering the turf in times of drought. In the case of the border around the lawn, it will be best to remove the ashes and prepare the ground thoroughly by digging deeply and manuring. Sometimes turf is laid specially on a layer of ashes with a view to making it drier in winter and spring, but this is an inefficient method of draining.

NAMES OF FRUITS: *P. H. R.* 1, Royal Jubilee; 2, Roundway's Magnum Bonum; 3, Dean's Codlin; 4, Bismarck; 5, Gascoyne's Scarlet; 6, Beurré Diel; 7, Hacon's Incomparable.—*J. M.* 1, Blenheim Pippin; 2, Beauty of Kent; 3, Hormead's Pearmain; 4 and 5, Reinnette Grise; 6, Decayed.

NAMES OF PLANTS: *Nemo.* 1, Nephrodium setigerum; 2, Selaginella Braunii; 3, Carex scaposa; 4, Nepeta Glechoma variegata.—*Supporter.* Tibouchina macrantha, generally called Lasiandra in gardens. The flowers would probably expand better at this season in a warmer house. Afford water with extra care in winter. *A. T. R.* 1, Vanda alpina; 2, Saccolabium ampullaceum; 3, Dendrobium nobile; 4, Dracæna marginata.

NATIONAL SWEET PEA SOCIETY'S TRIALS: *S. S., Mitcham.* Write to the secretary, Mr. H. D. Tigwell, Harrow View, Greenford, Middlesex, and he will give you the information you require.

PEAS DISEASED: *C. S. and Co.* Suspecting the Peas to be affected with the bacterial disease which Miss Cayley is investigating at the John Innes Institution (see p. 107), we submitted them to her, and she has replied as follows:—"The seeds enclosed show marked signs of a bad attack of the bacterial disease which I am investigating. So far I have found no cure, and diseased seeds should not be sown. They only infect the soil and make matters worse. A large number of varieties of Peas are very susceptible, especially the Marrowfats, Duke of Albany and Ne Plus Ultra. Also many of the dwarfs, like Little Wonder and Best of All. The organism, so far as I can see, is a soil organism, and hence very difficult to deal with. It occurs in most soils. Early sowing is advisable, as the bacteria can only develop rapidly in warm weather."

PHOSPHORESCENT CENTIPEDE: *Inquirer.* Your record is of much interest, as although certain Myriopods—e.g., Geophilus electricus—and other allied species are well known to give off a phosphorescent light, this remarkable phenomenon is not very often observed. It is strange, moreover, that a beetle should attack such a repulsive-looking creature, and we would venture to suggest that if the specimens are still in your possession you forward them to Professor E. B. Poulton, Wykeham House, Oxford, who is much interested in the subject of insects and their prey, and would fully appreciate any help you may be able to give him in this direction.

POINSETTIA PULCHERRIMA: *A. K. T.* The failure of the Poinsettias is probably due to the "liquid manure, such as drains from stable manure." This liquid is of very uncertain strength; sometimes it may be exceedingly strong, and in some cases it may even contain injurious chemicals arising from the disinfectants largely used in stables and cow houses. Too often the farmyard drainage is used undiluted, and trouble sooner or later is sure to arise. The roots of the plant you send are dead. The Camellia flower is of C. japonica (type). The Carnation certainly resembles the variety Lady Allington very closely, but we cannot undertake to say if it is identical. Send flowers to some grower who will compare them with stock plants.

PRIMULAS: *Devros.* The stems of the Primulas have been completely tunnelled by larvæ of some kind, but the only "maggot" which accompanied the injured plants was so completely smashed as to render its specific identity impossible. It is possible, however, that the injury may be due to the larvæ of a weevil belonging to the genus Otiorhynchus, but if you are desirous of having the insect identified send us more material. Needless to say, it is most difficult to suggest a remedy of a thoroughly practical nature, as the grubs are so completely protected; but you might by way of experiment inject a small quantity of bisulphide of carbon into the tunnels of a few plants and watch the result. It is just possible that the reagent may destroy the plants; but it is at least worth a trial, and as the Primulas are, in their present condition, almost useless no very serious harm can be done. We venture to suggest that the pest in question was introduced in the potting material (turf); if so, care should be taken in future to avoid using grub-infested soil without subjecting it to the action of heat.

UNSATISFACTORY FIG TREE: *W. M.* Take out a semi-circular trench about 2 feet deep, 30 inches from the stem of the tree, and cut clean away all roots protruding outside this space. At the same time, undermine the ball of earth and roots to some extent, and sever with a sharp knife all downward-growing roots that are found. This done, fill in the trench, adding a little lime-rubble or wood-ashes to the excavated soil. Afterwards place a layer a few inches thick of half-rotted stable manure over the circumscribed space as a mulch. Towards the end of April, when the tree is bursting into leaf, do what pruning is necessary, as the wounds will then bleed but very little. Moreover, it can then be easily ascertained which of the shoots are best furnished with young fruits. Cut out as many of the old shoots or branches as will allow of a like number of this year's growths being trained to the wall at about six inches apart, one shoot of the current year being trained in between these branches in due time. Pinch the points out of all extra strong shoots when about 18 inches long, and the weaker ones at 2 feet to promote a balance of growth in the tree as well as the formation of fruit buds for the following year and assist the swelling up of the fruit then on the tree. With this latter object in view the mulching should be renewed, and copious supplies of water given at the roots during this stage of the tree's growth, good drainage being provided.

VINES FAILING: *Colonel W. B., Dalton-in-Furness.* A reply to your query was published in the issue for October 25, p. 298. We have since written to you by post, but presumably the address you furnished was insufficient.

VINES: *S. H. G.* The sulphur of iron will do no harm if it is applied whilst the vines are dormant. It will be best to prune the rods before spraying them. The material may be dissolved in luke-warm water.

IS THE EARTH DRYING UP?

THE paper bearing this title, which was read by Professor J. W. Gregory at a recent meeting of the Royal Geographical Society, is a notable contribution to our knowledge of an important and difficult subject. No one denies that in the past the distribution of the two major elements of climate, temperature and rainfall, have undergone great variations, and that in consequence the distribution of vegetation has changed from time to time. But it is a far cry from the warm-temperature conditions of carboniferous times to the ice-sheets of the glacial period, or from the glacial period to the climate of our own time. We know from independent evidence that these changes took tens and hundreds of thousands of years, and the proposition that continuous changes of the same sort, of magnitude sufficient to vary the volumes and areas of streams and lakes, to modify vegetation, and so eventually to cause considerable migrations of the human race, have occurred over large areas since the dawn of history, is difficult of acceptance.

Yet it cannot be denied that in many parts of the world there are appearances which go to support this proposition. Many travellers in the arid regions of the globe bring news of shrunken lakes and streams, of dying vegetation, and of long-deserted cities; and draw, as it seems irresistibly, the conclusion that rainfall has diminished. Again, students of biblical and classical history have compared present conditions with those described in contemporary records, to find that Mesopotamia and Palestine, Egypt and Greece have so diminished in productiveness through shortened water supply that it is now impossible for them to maintain the population they once did. And these are no vain imaginings of the uninstructed; they are associated with the names of Kropotkin, Aurel Stein, Ellsworth Huntington, Myres, and a host of skilled pioneer explorers and surveyors.

Professor Gregory has, with immense labour, sought out and summarised the facts, and in this alone he has rendered a great service. The "list of references" appended to his paper contains many dozens of entries, and it is independent of the detailed references to Scripture and the classics in the text, in which the author has had the expert assistance of such authorities as Professor Stevenson, Mr. A. W. Gomme, and Principal George Adam Smith. But he has not merely collected the material: he has subjected it to searching and exhaustive criticism, and the criticism is, as it proves, destructive. The conclusion quite clearly set forth is that "there have been many and world-wide climatic changes in late geologic times, while in historic times there has been no world-wide change of climate."

It is not practicable within the limits of space at our disposal to give even an outline of the methods employed by Professor Gregory; different methods are elaborated for almost every one of the separate regions of which he treats. A few examples must suffice to indicate their ingenuity and delicacy, and, we may add, their effectiveness.

To decide a question of secular variation of climate a more precise test is necessary than can be afforded by the variation of lakes or the ruin of cultivated lands or cities; for these occur in marginal regions of climate, it may be in consequence of catastrophic events such as earthquakes, or minor accidents like movements of wind-blown deposits, or even (in the two last cases at least) from political or geographical causes operating altogether outside the area concerned. A better test is best afforded by changes of vegetation of a kind not wholly destructive, such as changes which have taken place in the range of food plants or fruit trees in the countries of which we have the longest written records. Palestine furnishes a very good test case of such a nature. Professor Gregory produces a formidable array of authorities to show that no conclusions based on definite numerical statements given in scriptural writings can be maintained; and then proceeds to review the evidence obtained by Schouw, Arago, Forbes, Eginitis and others from the distribution of the Date-palm. The Date-palm has three limits of growth which are determined by temperature; it only reaches full maturity and produces ripe fruit of good quality at or above a mean annual temperature of 69° F. Between 69° F. and 62° F. the fruit is usually so unripe as to be inedible. Below 62° the Date-palm is grown only for its foliage; it does not fruit. Now the mean annual isothermal line of 69° crosses Southern Algeria near Biskra; it touches the northern coast of Cyrenaica, near Benghazi, passes Egypt near the mouth of the Nile, and then bends northward along the coastlands of Palestine. The isotherm of 62° F. enters Europe in south-western Portugal, passes south of Nice, skirts the north-western coast of Italy to Naples, crosses Northern Greece, and enters Asia Minor in Smyrna. Hence at Benghazi the Date-palm is fertile, but produces fruit of poor quality; at Palermo and Algiers the fruit ripens occasionally; at Rome and at Nice the Palm is only grown as an ornamental tree. Dates grow on the coast of Palestine, and in the deep depression round the Dead Sea; but the Palm does not produce fruit on the highlands of Judæa.

In biblical times Jericho was "the city of Palm trees," and the fact that the Palm has died out since must be merely the result of neglect, for it could not have grown if the climate was moister and cooler. Engeddi, on the western shore of the Dead Sea, also had Palm trees; and the Date-palm certainly grew on the highlands of Palestine. But there was no Date crop. Dates are not once referred to in the text of the Bible. The Palm tree is praised for its beauty and erect growth; it is used as a symbol of victory, but not of plenty. If then the climate had been seriously different either way from what it is now Jericho would not have held the distinction of *the* city of Palm trees; for in a hotter and drier climate Dates would have ripened on the highlands; in a colder and moister they would not have ripened at Jericho.

The evidence of the Vine supplements that of the Date. Where the mean annual temperature is above 72° the Vine requires artificial shade and protection. In Cairo, for example, it must be kept cool and moist. Palestine lies to this day on the extreme edge of Vine-cultivation, just as it did when the twelve spies returned from Eschol with the clusters of Grapes. There can have been no change of any practical importance in the climate of Palestine since the days of the Patriarchs and of the Jewish Kings.

In North-Western Europe and the British Isles the methods applicable are necessarily somewhat different. The engineering works of the Romans suggest that British rivers carried very much the same volumes of water in Roman times as they do now. Records of "severe" winters and "hot" summers are uncertain things at the best, and if they do suggest that the climate of Denmark and Southern Scandinavia shows a diminished range of temperature during the last thousand years—and the fact seems still scarcely established—there appears to have been no appreciable change in the average annual temperature or in the mean rainfall. Much has been made of the disappearance of Vine-cultivation for wine-making in England, but there is even now no difficulty in cultivating the Vine in the open; the trouble is with the quality of the vintage. As Professor Gregory wisely remarks: "In the Middle Ages people were contented with

worse wine and ate sourer Grapes than they will now, when the superior produce from Southern Europe can be bought at a cheaper price than the inferior local product."

Professor Gregory's methods of treating the evidence from marginal areas near the arid regions are no less illuminating and conclusive, and the whole paper is exceedingly suggestive. It is remarkable, by the way, that none of the long-period records of instrumental observations of temperature or rainfall, which now cover periods of 100 to 150 years with reasonable precision, give any hint of secular change.

But we fear that Professor Gregory must expect not to be believed. It has been proved to demonstration that the weather is not fore-ordained or predetermined by the phases of the moon, and that there are no such things as equinoctial gales, yet, knowing these things to be mere superstitions, we continue steadfastly to believe in them all the same. *D.*

FLORISTS' FLOWERS.

NOVELTIES IN PERPETUAL FLOWERING CARNATIONS.

AT the show held on the 3rd inst. a few really good novelties were to be seen, and seven varieties gained Awards of Merit, five of them not being yet in commerce. I have grown the remaining two varieties here and can recommend them, especially Queen Alexandra. This is a sport from Scarlet Glow, a lovely bright salmon colour. It is quite the best of its colour, and has no equal for general decorative purposes. Enchantress Supreme, the other variety to secure an Award, is an American sport from the old favourite. It is rather deeper in colour and has a better calyx than Enchantress, and the calyx does not split. Of those not yet in commerce two come from America, and both should prove acquisitions. Champion, Mr. Dorner's new scarlet, secured the medal for the best vase in the show. This is the scarlet which has long been looked for. Gorgeous is one of Mr. Peter Fisher's novelties, and if we can judge it by the blooms exhibited, it is a variety with a very great future. The colour is bright cerise and the flower is of giant proportions.

Cinderella was exhibited by its raiser, Mr. Fairbairn, and appeared a very pretty variety. It might be called a Mikado with bright scarlet markings. Lady Fuller was exhibited by its raiser, Mr. Wall, and I think will prove the best of the Lady Allington type. It is a much brighter colour and has a stiff stem.

Pioneer, the other variety to get an Award, is one of Mr. Engelmann's seedlings. It is of a rose-pink colour, and the blooms and plants exhibited suggest that it will be a good commercial variety.

Among others which were not staged for awards, the best I noticed were Circe, Scarlet Carola, Variegated Carola, and Wivelsfield White. Of the latter variety I had the pleasure of seeing several thousand plants growing at Wivelsfield, doing well. It is a rather more solid flower than White Wonder, and at Wivelsfield was certainly freer and quicker in growth. Another variety which was looking extraordinarily well at Wivelsfield was Mary Allwood. No one who visited the show could have failed to admire the many vases of blooms of this lovely variety, and I am sure it has a future. Other novelties sent out this year which are worth notice include the best British raised white, Fanny; a fine fancy, Mrs. A. F. Dutton, which I consider one of the best Carnations ever introduced; and Salmon Enchantress.

Of the older varieties the best are White Wonder, White Perfection, Scarlet Glow, Carola, Triumph, Lady Northcliffe, Enchantress, Mrs. Ward, Rosette, Mikado, Benora, Sunstar and May Day. *H. E. Usher, Ranston Gardens, Blandford.*

CYPRIPEDIUM BOURTONENSE.

OUR illustration (fig. 158) represents on a reduced scale the C. Bourtonense (insigne Harefield Hall × Blanche Moore), for which the raiser, G. F. Moore, Esq., Bourton-on-the-Water (gr. Mr. Page) received an Award of Merit at the Royal Horticultural Society's meeting on December 16 last. The flower has a greenish ground

FIG. 158.—CYPRIPEDIUM BOURTONENSE. (Reduced.)
(R.H.S. Award of Merit, December 16, 1913.)

colour, tinged and spotted with chocolate-purple, the upper part of the dorsal sepal and half of the lower sepals being white. The latter are unusually strongly developed, a character which may be found to be subject to variation.

THE STERILISATION OF GRASS SEED.—Experiments on the effects of antiseptics on grass seed led SCHRODER to conclude that so strong a solution as 5 per cent. silver nitrate produced no ill effect on germination, and he suggested, therefore, that silver nitrate would prove to be a valuable agent for sterilising the coats of grass seed. More recent experiments by BIRCKNER (*Biol. Cbl.*, 33, 1913), show that 1.7 per cent. solution of silver nitrate reduces the germination to 80 per cent. of the normal. Solutions of one-tenth this strength are also injurious if allowed to act on the seeds for eight hours; but if seed be exposed to the dilute solution (0.17 per cent.) for a shorter time no ill effects are produced.

GARDEN DESIGN.

Mr. EDWARD WHITE delivered a lecture on "Garden Design" at a meeting of the Royal Horticultural Society on December 2.

He said that notwithstanding the complexity of the subject of garden design there was one issue which was quite simple. One always desired to arrange in a garden a few principal pictures, dominated by the house, with which were combined a number of secluded scenes of a specialised character; one condition being that the latter should not destroy the breadth of the principal views. The enduring charm of the garden depended upon variety and individuality, derived preferably from some characteristic natural to the site. Instead of adopting conventional ideas and methods, there should be impressed on every garden a character as distinct as possible from that of any other. If this condition were accepted, it followed that the continued aim of the landscape gardener should be to cultivate his own imagination and stimulate the same quality among his clients. Thousands of years ago people realised the charm of an ordered arrangement of flowers as an accessory to a building, and the originator of the idea of a garden, Mr. White thought, would have been gratified if he could have foreseen the development of his conception through the ages, and interested to follow the discussions connected with garden design. The lecturer mentioned that at the early period of the invention of printing the art of gardening was well established in this country, and in many respects there was little difference between the plan of the earliest flower gardens and those of the present day.

There had since been many sharp controversies on the subject of garden design, and in view of the virtues attributed to gardening, it was curious that the discussion of its principles should often be conducted with acrimony and unfairness, some distorting views from which they differed to an unfortunate extent. It was good to study every opinion, but it was desirable that conflicting statements should be put one against another by the student of garden planning, who should reserve his judgment until he had had sufficient experience to form independent opinions. It would be understood that those remarks referred particularly to the well-worn discussion on the respective merits of formal and informal gardens. In his opinion sufficient service had already been performed by argument. They knew that there existed in this country many beautiful specimens of each style which the ablest advocate of either system would hesitate to alter in favour of one more acceptable to himself, and from this they might infer that either form might be right in the right place and that the two systems were not necessarily in conflict. Informal gardens, he remarked, were specially suited to a climate like ours, which was favourable to the luxuriant growth of grass and shrubs. He did not hesitate to advocate either system in the place to which it was best fitted.

Proceeding to define the two styles, the lecturer said it was well to understand what they meant by the words formal and informal. Formal gardens in some minds meant only a system of expensive parterres and conventional design, but the definition he suggested gave a more liberal interpretation. As he understood it, it was one in which the designers frankly disciplined Nature. They allowed her no voice in the shape of the garden, which was intentionally artificial, and thus accepted no practical guidance from her as to the kind of picture they created. Formality implied methodical arrangement, and generally carried with it a character of symmetry and regularity. There was no reason why the formal garden should be lacking in touches of a tender nature. In the informal garden they affected to indulge Nature, but in reality they tried to coax her into a mood of their own

choosing. They did not pretend to copy Nature, but they accepted hints from her, and arranged their masses and groups in forms which they knew Nature could develop to the most picturesque advantage. Informal gardens should bear evidence of care and attention, because it was advisable to give an air of effect and refinement in keeping with the character of the house.

The standard test of suitability was that there should be a feeling of complete unity between the house and the garden. It must also be remembered that fitness of the site was essential. No definite rules could be laid down, but there were certain conditions under which one style or the other might be more appropriate, since there were wide differences between various types of architecture and sites. The lecturer referred to the classical style of mansion and other types of houses, with terraces necessitated by steep slopes, and said that flat sites required no such artificial support. When the distance view was of dominant importance in the outlook the effect might be weakened by introducing intricate garden details in the foreground. When there was no distant view, or an uninteresting one, a formal garden could generally be employed to advantage, as also when the only view was confined to a narrow vista on a central axis. A small site with no external view could generally be made more interesting when treated formally, and its limitations could be concealed by sub-division and variation of level. Speaking generally, he thought one might say a formal garden could be arranged legitimately when it did not entail the destruction of any existing trees or other natural features which were particularly worth preserving; when the area was limited, or when the external scenery was not such that it must always be of greater importance in the main picture than the garden.

Speaking of informal gardens, the lecturer said that many had been constructed on wrong principles, a complaint of long standing, as a century ago they found a poet satirising effects which the maker of informal gardens was constantly being urged to avoid at the present day. It was an elementary condition of the garden, he said, that it should be united harmoniously with the house—that is, neither garden nor house should appear to be isolated, and each should rely upon the other to give a sense of completion. The first means to this end was to ensure that the walls or the building should be incorporated with a strong base, and that the garden also should seem to derive its inspiration from the same source. This base was usually called the terrace, but it should be understood to consist not only of the raised part on which the house stood, but the whole foundation and setting of the building. Most houses were improved by a certain elevation above the garden, but a perched-up effect should be avoided. The terrace should not be so broad as to cut off the view. If the levels necessitated three terraces, the lowest should be the widest. An important means of creating a sense of unity was to extend the axial lines of the house into the garden, so that from all the principal exits one looked into a vista picturing the heart of the garden. Other means were to frame the house attractively from a few points of view, and to arrange the tour of the garden in such a way that one could leave the terrace at one end and rejoin it at the other without retracing one's steps in the circuit. If such a feature as a fine old tree could be associated with the terrace or combined with a path connected with the latter a feeling of stability was created. The framing of the house by trees, the use of climbing plants on the building and of shrubs at the point of connection between the terrace and garden, were valuable aids to unity.

On the subject of garden planning the lecturer emphasised the importance of the lawn, and said it was a medium which united and gave stability. It was not surprising that no substitute could be found to compete with grass as a foreground in garden landscape. Whenever one was in doubt what to do with ground in front of a house no safer expedient could be adopted than establishing greensward. Many gardens were spoiled by the idea that this was the situation calling most loudly for the introduction of brightly-coloured flowers. The placing of the right trees and shrubs in the right places was a matter of commanding importance. Another matter referred to was the balance and proportion obtained by the proper combination of trees and shrubs and grass. A great problem was to dispose grass and plants in such a way that the limitation of neither would be noticeable. One must try to establish an intricacy which was midway between uniformity and confusion. The site was sometimes so restricted that it offered opportunities for no more than one principal picture, and in such a case it was better to concentrate on this one picture. A landscape effect was more satisfactory when it was based on one dominating line of view, because scenes in which two or three vistas competed for notice produced a distracting and confused result. The position of the chief masses of planting must first be settled. This would be decided more or less arbitrarily by the necessity of finding shelter from winds, screening unsightly objects, etc. Other masses would be arranged to provide a rough balance of composition, small groups being placed to connect larger masses, and still smaller groups and trees and shrubs being utilised to complete the sense of continuity. Boundaries would not be planted continuously except for some necessary reason, and openings would be left to frame some distant object, such as a church spire, or bridge, or other feature. Many external objects which scarcely occasioned remark when we saw them in open country became treasured possessions when framed in the garden picture.

The texture, shape and colour of the leaves and habit of the tree had to be considered. A good result was effected by the planting of large masses of the same kind of tree of unobtrusive shape and texture, as they formed a backbone to the garden and helped to emphasise neighbouring trees of a more conspicuous character. A group of trees should generally consist of a larger proportion of such foliage than of the lighter and more feathery kinds. Dark and heavy greens could be used for groups in association with old buildings, and lighter shades where a less serious treatment was required. The feathery kinds were best planted near water. There were so many trees of beautiful form and texture which had lovely flowers in the spring and a wide range of tints in the autumn that the balance was in favour of their use rather than that of an excessive number of trees of brilliant foliage. A combination of foliage in colours which were rightly contrasted was generally more effective than that in which the shades were somewhat similar. It might be asked, in giving such dominant importance in the arrangement of a garden to trees and shrubs, was he not going to grow flowers, on which depended so much of the pleasure of a garden? Provision for flowers would, of course, be made, but Mr. White pointed out that the informal garden was generally more picturesque and inviting in winter than the formal garden, and if this result was to be obtained large areas in central lines of view could not be utilised for flowers, as the effect of these areas was bare and desolate in winter. There were opportunities for symmetrical arrangements on the terrace, and large masses of flowers could be arranged with groups of shrubs. Other flower-beds could be placed at the intersection of paths, and special gardens—rose gardens, rock gardens, and water and other gardens—constructed in secluded parts. The informal garden did not lack facilities for the introduction of as many flowers as one would wish, and the style need not necessarily represent a mere collection of trees and shrubs, which naturally were insufficient to satisfy most people's idea of a garden.

There were not many of the largest gardens in England which could be described as either strictly formal or informal. The style now recognised as distinctively English was expressed by a happy combination of all styles, assimilating them in harmonious manner. Mr. White referred to the formal gardens of Italy and France, and said the revolt against the French and Dutch styles facilitated the great revolution effected by informal landscape gardeners a century and a half ago. The style of Le Nôtre, the great French garden architect, however, must have had world-wide influence, as was evident from operations under his own control, in Sweden, Germany and France. The general principle of those gardens designed originally by Le Nôtre was very similar, and the expense of construction must have been enormous. Considered from our present point of view, the result was scarcely worth the outlay. He described one of the gardens of the King of Sweden. There were avenues of magnificent old Limes, deficient in places, upon which Mr. White said he was asked to give an opinion concerning the suggestion to cut down the remaining trees and replant the avenues with young trees. Such an idea would not be entertained in England, and he suggested suitable treatment of the roots and the addition of vigorous young trees where required. He was next asked his opinion as to reinstating the old plan, and he thought the idea was justifiable and preferable to working out a new design. The great principle of construction was the formation of a strong central vista, which extended for a distance of about 1½ miles, ending in a pavilion on the top of a hill. In the garden at Berlin the most was made of the central picture on the line of the main avenue, and other improvements were outlined. In reference to the influence of formal gardens of this nature in England, they required for their full effect such immense areas of flat land that in many situations they would be impracticable even if one would wish to have them. They were dignified, and the avenues offered many fine effects, but these gardens did not compare, from the point of view of a lover of horticulture, with English gardens, which had less formality and more intimate feeling.

Mr. White illustrated his lecture with a number of excellent lantern slides of English gardens which enabled the audience to appreciate the varieties of design. One gave a view of a Japanese garden. Mr. White said that we called them Japanese gardens in this country, but he did not think they were very like real Japanese gardens, which were largely symbolical. A distinguished Japanese gentleman was taken to a place in England where there was such an English version of a Japanese garden, and when he left he assured his host there was nothing like it in all Japan.

FOREIGN CORRESPONDENCE.

ARTEMISIA SACRORUM VIRIDIS.

PLANTS of Artemisia sacrorum viridis (see p. 385) in these gardens have remained uninjured by 10° of frost. The foliage is very decorative, and is especially useful for arranging with Chrysanthemums. This elegant plant always attracts attention, and is worthy of extended cultivation. Your correspondent omitted to mention that the leaves are agreeably scented. *H. Rabjohn, Twickel Castle Gardens, Delden, Holland.*

PLECTRANTHUS CILIATUS.

A SPECIMEN of this pretty African plant, imported from Basutoland, is sent by Mr. Willy Müller, Naples, with the following remarks:—"For autumn and winter-flowering Plectranthus ciliatus is a very lovely plant. It is now in fine flower with me, and in my houses this is the

only showy plant now in bloom. The habit is compact; the stems covered with purple hairs, and the underside of the broad, bright-green leaves coloured purple red. The white flowers

FIG. 159.—ODONTOGLOSSUM CLEOPATRA; SEPALS AND PETALS COLOURED LIGHT REDDISH-PURPLE.

tinged with lilac spots are very lovely, and last a long time in bloom." It appears to be a very useful species, and as it can be propagated readily would make a good subject to grow in quantity for winter flowering.

SCOTLAND.

A WINTER GARDEN FOR EDINBURGH.

A SUB-COMMITTEE of the City of Edinburgh Lord Provost's Committee has resolved to recommend the erection of a Winter Garden at the east end of the West Princes Street Gardens. The plans have been prepared by the City Superintendent of Works and Mr. J. W. M'Hattie, the Superintendent of the City Parks. It is estimated that the building will cost about £10,000, exclusive of certain other items, such as the laying out of the grounds and furnishing. The plans show a handsome building, with considerable seating accommodation, and provision for promenades. *Correspondent.*

ODONTOGLOSSUM CLEOPATRA.

THIS beautiful Orchid was granted an award of Merit by the R.H.S. Orchid Committee on the 16th inst., when exhibited by Mr. de Barry Crawshay. The sepals and petals are coloured light reddish-purple, with a narrow primrose margin and tip. The parents were O. Carmania and O. Vuylstekei. O. Carmania was raised from

Photograph by W. J. Vasey.

FIG. 160.—DAHLIA KAISERIN AUGUSTA VICTORIA IN HAMPTON COURT GARDENS.
(One of the best white garden Dahlias.)

Lucasianum × Harryanum, and not cristatellum, as stated on p. 449. The lip of O. Cleopatra resembles that of O. Harryanum, being broad, white in front and marked with purple on the basal half.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

CHYSIS.—The pseudo-bulbs of Chysis aurea, C. bractescens, C. lævis, C. Limminghii, and the rare hybrids C. Sedenii and C. Chelsonii having attained to their full size, the plants should be suspended in a light part of the cool resting house. The amount of water afforded the roots should be diminished gradually until, when the leaves have fallen, and the new pseudo-bulbs become properly ripened, scarcely any water will be needed. The flower spikes develop in spring and early summer in conjunction with the young growths. Plants that are still growing actively should be placed in a warm, moist atmosphere until the pseudo-bulbs are matured.

ODONTOGLOSSUM CITROSMUM requires a long period of rest and should be treated as advised for Chysis.

PERISTERIA ELATA.—The Dove Orchid grows best in a warm temperature in company with deciduous Calanthes. Immediately the pseudo-bulbs become matured, remove the plants to the drier atmosphere of the Cattleya or Mexican house. The rooting compost should be kept on the dry side, as the plant requires a long period of rest, and if this is not afforded blooms may fail to develop.

CYRTOPODIUM.—C. Andersonii, C. St. Ledgerianum and C. punctatum have almost completed their growths, and the plants may be dried off gradually until water is withheld entirely. Cyrtopodiums require a very warm temperature when in active growth, but whilst at rest they should be placed in the same house as Chysis.

THUNIAS have now cast their leaves, and the old shrivelled stems from which the current season's growths have sprung should be cut down to their bases and the new stems trained to neat sticks placed at even distances apart. While the plants are dormant they may be placed with the deciduous Dendrobiums that are resting.

DECIDUOUS CALANTHES.—When the plants have finished blooming, place them on a rather dry shelf or stage in a house having an atmospheric temperature of about 60°. Water may be withheld from the roots entirely until the plants need re-potting in the spring. Previous to removing them to their resting quarters examine each pseudo-bulb carefully for the presence of white and brown scale insects. The deciduous Eulophias should be treated similarly.

MISCELLANEOUS ORCHIDS.—The pretty Comparettia macroplectron is in bloom; after the flowers have faded afford the roots but very little water, but give plenty at the stage of active growth. It thrives best in small, shallow pans, filled with only a thin layer of finely cut Osmunda-fibre. Plants of Miltonia vexillaria are in full growth and should be examined occasionally for the purpose of slitting the sheaths around the bases of the leading growths, to permit the young roots to grow unrestricted. The leaves also often cling to each other and need separating carefully. Should their tips turn brown and damp off, keep the roots drier for a few days, and do not sprinkle much moisture between the pots. M. Roezlii, M. Phalænopsis, M. Charlesworthii, M. Bleuana, and M. Hyeana make their growth at this season, therefore the roots need plenty of moisture. They grow best in the Cattleya house during the winter months. The new pseudo-bulbs of Odontoglossum pulchellum are mature and the plants may be rested; the roots are prone to decay if the compost is kept very moist at this stage. A light position in the intermediate house is suitable for them at all seasons.

Cochlioda vulcanica is now in bloom in the cool house; the graceful spikes of rose-coloured flowers have a pretty effect, suspended just above the foliage of the Odontoglossums. Other Cochliodas, including C. Noezliana, C. sanguinea, C. rosea, and C. stricta, are developing new growths and some of the plants may need re-potting in shallow pans or pots that can be suspended near to the roof-glass. Half fill the receptacles with drainage materials and for the compost employ equal parts of Osmunda-fibre and Sphagnum-moss. These Orchids require plenty of light and an abundance of water at the roots at all seasons. Other Orchids that need similar attention include Maxillarias, many of which are commencing to grow. The plants require as much air and moisture as the other occupants of the cool house. Any plants of Sophronitis grandiflora that need re-potting should be attended to immediately after the flowers have faded.

PLANTS UNDER GLASS.

By F. JENNINGS, Gardener to the DUKE OF DEVONSHIRE, Chatsworth, Derbyshire.

CINERARIA.—The earliest plants are on the point of flowering and should be arranged in the greenhouse or conservatory, regulating the temperature according to the time they are wanted in bloom. Feed the roots with a suitable concentrated fertiliser, alternated with soot-water and liquid cow-manure until the flowers show colour, when clear water only should be used. After the plants are housed they should be fumigated at once, and again at regular intervals.

GARDENIA.—Plants on which the flower buds are swelling should be fed in the same manner as advised for Cinerarias, to give strength to the blossoms, which should be disbudded of small side ones. They should be grown in a night temperature of from 65° to 70°. Should mealy bug be present, syringe with an insecticide containing paraffin before the flower buds are far advanced. Soluble paraffin may be employed, or the old-fashioned method of a thumb potful of paraffin to three gallons of water with soft soap added. The contents of the bucket must be kept stirred, otherwise the paraffin will rise to the surface and may be drawn into the syringe unmixed with the water, in which case it will destroy the foliage. Old-established Gardenias planted out in pits should be watered on mild days, and the roots afterwards soaked with manure water.

THE FLOWER GARDEN.

By EDWARD HARRISS, Gardener to Lady WANTAGE, Lockinge, Berkshire.

POTTING BEDDING PLANTS.—The cuttings of Pelargonium, Iresine, Ageratum, Salvia, Coleus, Fuchsia, and other bedding plants rooted in boxes or pans in the autumn may be potted into small pots. Having decided upon the general scheme of bedding for next season, the work of propagating the various plants may be proceeded with. Cuttings of Iresine, Ageratum, Lobelia, Fuchsias, Salvia Glory of Zurich, and Heliotrope will readily root now, and most of them will make good plants by the time for planting. Lantanas must be kept growing in a warm, moist house, including those intended for standards. Calceolaria amplexicaulis is a very effective subject when trained as a standard, and some of the best of the young plants which were rooted in cold frames should be selected and potted into 4½ inch pots for the purpose. Stand the plants in a light position in a house having a minimum temperature of 50°, and treat them as advised above.

A RETROSPECT.—The past season cannot be said to have been unfavourable to the majority of flowering plants out-of-doors; indeed, in many respects it was distinctly suitable. Nearly all kinds of plants flowered profusely, and a notable feature was that most of them continued in bloom for a much longer period than usual. The year has been marked by extraordinarily long periods of sunless weather. June was the hottest and driest month. Since June 30th the thermometer has only reached 80° on three occasions. In September we registered 75° on two occasions and 70° on only seven days. The longest period of drought occurred between May 14 and July 7. No appreciable amount of rain fell during the whole of that time, and as on most days brilliant sunshine prevailed, plants suffered from drought, especially in gardens with a limited supply of water. Border plants were affected most. The value of lifting hardy herbaceous plants every two or three years for the purpose of digging and well manuring the ground was never more apparent. The season proved favourable for Roses of all kinds. Many varieties flowered during the whole of the season, and at the time of writing (Dec. 18) there are plenty of good blooms in these gardens. The plants have grown well, but the shoots are not hard, and severe frosts may injure the more tender sorts. It will be wise, therefore, to have in readiness plenty of protecting materials now that the season is far advanced.

THE HARDY FRUIT GARDEN.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL, Moulton Paddocks, Newmarket.

THE ORCHARD.—Orchard trees should be examined for the presence of American blight, which is easily detected whilst the tree is defoliated. In cases of bad infestations scrub the branches with Gishurst Compound, made fairly strong with warm water. Apply the specific whilst it is still warm by means of a soft scrubbing brush. In many cases the worst infestations will be found on the trunk at the base of the tree. Where this is the case the soil should be removed to the depth of several inches and the bark washed thoroughly with the insecticide. Fill in with fresh loam, mixed with lime. The discarded soil may be infested and should be carted clear away or sterilised by burning. Where only an occasional colony of the blight is noticed this can easily be destroyed by damping the affected parts with methylated spirits. Whenever old buildings are demolished or repaired, the mortar rubble and some of the broken bricks should be secured for the fruit garden. The materials are valuable for incorporating with the soil of fruit borders, and more especially new borders formed of fresh loam. Iron trellis work which has become corroded with rust, also new galvanised wire, should either be painted or tarred before the trees are fastened in position. Certain birds are becoming troublesome, more especially the bullfinch. If two bullfinches only commence on an orchard or fruit plantation they will do enormous damage in a very short time. Bush trees which have been planted in plots can be protected by netting; the buds of Plums and Pears, which these birds despoil in particular, should be dressed with some distasteful material. In times of bad weather, when work outside is stopped, prepare labels, resharpen and paint stakes, boil new wall nails in oil to prevent them from rusting, and pick out the best of the old nails and shreds for use again.

FRUITS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the DUKE OF BUCCLEUCH, Dalkeith Palace, Midlothian.

PINEAPPLES. — Fruiting plants of the Queen variety intended to furnish ripe fruits early next season, having been kept dry at the roots, and grown in a minimum temperature of 55° to 60°, should, between this date and the middle of January, receive a thorough watering at the roots. Increase the night temperature to 70°, taking advantage of sun heat to raise it 10°. The bottom heat should be maintained at as near 90° as possible. Increase the amount of moisture in the atmosphere by sprinkling the paths and walls two or three times each day, but do not allow water to enter the centres of the plants. Suckers potted last August and September are well rooted, and must be rested until the beginning of February in a house having an atmospheric temperature of 55° to 60°, when they may be potted into their fruiting pots. In the meantime examine them occasionally to see if water is required, for the soil must not become excessively dry. Winter-fruiting Pines with fruit swelling should be grown in a minimum atmospheric temperature of 70°, and at least 85° bottom heat. Maintain a moist atmosphere, and examine the plants weekly for watering, keeping the soil in a moderately moist condition, and using weak guano water at each application. Suckers of these winter varieties (from which the fruits have recently been cut), if potted into 6 or 7 inch pots and rooted in bottom heat, will develop into good plants by next June.

STRAWBERRIES.—The earliest plants, which were plunged in a mild bottom heat in November, are throwing up their flower spikes, and should be placed on shelves, near the roof-glass. The temperature of the house should be 55° to 60°. Spray the plants both morning and afternoon with warm water. A little Quassia Extract may be placed in the water occasionally to destroy aphides and mildew. Weak manure water will provide a suitable stimulant for the roots. Successional plants may be placed on shelves near to the roof-glass in the early Peach house or vinery. Care must be taken to keep the Strawberries free from insect pests, as these may spread to the vines or Peach trees and cause considerable injury. Where other houses are available, Strawberries should be grown for as short a time as possible, in either vineries or Peach-houses.

THE KITCHEN GARDEN.

By JOHN DUNN, Foreman, Royal Gardens, Windsor.

CARROTS.—The Carrots sown in July are still growing, but a portion of the crop should be lifted and placed under cover before severe frosts occur. The remainder may be left in the ground for another month, covering the plants in very cold weather with dried Fern fronds or other light material. Parsnips may be treated in the same manner. This vegetable is a light crop in many gardens in consequence of the dry weather of June.

LETTUCE.—Plants raised from seed sown in pits in September should be transplanted in light soil in a cold pit at a distance of 9 inches apart each way. Water the roots afterwards to settle the soil, and when the plants commence to grow again ventilate the pit freely, or many may damp off. Stir the surface of the bed at frequent intervals with the Dutch hoe, and keep a careful watch for slugs during dull, damp weather. Lime is the best deterrent for these destructive pests. A sowing of May King, Pioneer, and Golden Ball varieties should be made in a cold pit to furnish plants for setting out of doors in the early spring.

ENDIVE.—Late-sown Endive may be lifted from the open garden and placed in cold pits where free ventilation may be afforded. Damping must be guarded against. When the plants have grown to their full size the leaves may be tied together to blanch them, allowing about ten days for etiolation.

CHICORY should be lifted and placed in a dark chamber for forcing. The young growth damps readily, therefore excessive moisture either in the soil or atmosphere must be guarded against. Place the crowns about one inch above the soil. Slugs are fond of this salad, but hot lime placed along the edges of the bed serves as a protection.

SEAKALE.—When the roots are lifted for forcing select suitable portions of the roots for next season's crop. These should be straight and clean, and may be cut into portions each about 7 inches long. Place them closely together in a horizontal position, and cover them with four inches of sharp, sandy soil. Nothing more will be necessary until frosts occur, when they may be covered with dry fern or ashes. Seakale roots should be placed in the forcing pit every eight days in order to maintain a continuous supply. A temperature of 55° is suitable.

CAULIFLOWER.—It is not too late to pot the remainder of the plants growing in cold pits if they are wanted. Employ 60-sized pots filled with a mixture of rich loam and leaf-mould. A sowing of the varieties Dean's Early Snowball, Magnum Bonum, and Great Dane may be made now in boxes. The last-named variety is of recent introduction, and proved a valuable crop at Frogmore early in the summer.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher. — *Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Special Notice to Correspondents. — *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich, 38.3°.

ACTUAL TEMPERATURES :—

LONDON, *Monday, December* 22, (6 p.m.): Max. 39°; Min. 32°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Tuesday, December* 23 (10 a.m.): Bar. 30.2; Temp. 42°. *Weather.*—Dull.

PROVINCES.—*Monday, December* 22; Max. 42°, Lancaster; Min., 36° Yarmouth.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—

Rose Trees, Shrubs, Perennials, Lilies, etc., at Stevens's Rooms, King Street, Covent Garden, at 12.30.

THURSDAY—

Special Sale of Roses at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 1.

FRIDAY—

Bulbs, Herbaceous Plants, Roses, Fruit Trees, etc., at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 12.

STOP PRESS.—Since these pages were sent to press, news has reached us of the death of Sir Trevor Lawrence, Bart., V.M.H., late President of the Royal Horticultural Society.

1913.

The years, as they form the turned pages of the book of the past, leave behind them strangely varied impressions. One large event stamps a particular year with its prestige and we remember it by the event. Such a one is 1912, which to all good horticulturists is the year of the Great Exhibition. Other years, marked by no striking circumstance, fade away into oblivion almost unnoticed. Yet to the sober observer who lacks the flamboyant temperament the grey years are often more significant than are those with purple patches. The latter are the fat years, the former the lean years; and as the lean kine ate up the fat kine, so the sum of the minor events of the grey years, when set in Time's perspective, dominate the large-looming and isolated occurrences of the years of purple patches. Such will be—as we conceive—the judgment of horticulturists of the future on the year now waning: a year of enduring good work rather than one of brilliance like its precursor. Nor is it strange that memory and judgment should record contrary verdicts: for memory leaps to the achievement, whilst judgment applauds the preparation. Memory recalls the grace and perfume of the flowers; judgment approves more coolly yet more enduringly the prosaic preparations of the seed-bed and the sowing of the seeds in due season. The year 1912 was a year of flowering, 1913 one of spade-work and seed-sowing.

During the present year those who seek the advancement of Horticulture have been active in many directions. At the Ghent Quinquennial Show international Horticulture demonstrated the advances which it is making. At Chelsea our own growers showed that they had learned much from the exhibition of the previous year: and perhaps the most interesting exhibition of all has been the new departure of the National Rose Society—the May show of Roses grown under glass.

The past year has witnessed a notable advance in horticultural education. In the National Diploma, established jointly by the Board of Agriculture and the Royal Horticultural Society, the young gardener has open to him a means of proving his skill and, as is to be hoped, of improving both his own status and that of his profession.

The Horticultural Branch of the Board of Agriculture, "whose interests"—to quote the Right Hon. Walter Runciman—"shall be devoted entirely to Horticulture and nothing else," has passed through the first year of its existence, and though it has not yet had time to do more than make a commencement of the big task which it has undertaken, we may hope that it will include in that task such important questions as railway rates, market facilities, and the horticultural aspect of small holdings and allotments.

The most noteworthy horticultural event in the Dominions has been the establishment of a Botanic Garden in the Cape Peninsula. The formation of the garden by the Union of South Africa is due to the persistent and tactful advocacy of Mr. H. W. W. Pearson and to the powerful support of Sir Lionel Phillips. At home, the Society for the formation of National Reserves has met with conspicuous success in its efforts to preserve as open spaces tracts of country of scenic or scientific interest. Blakeney Point, in Norfolk, and Box Hill, in Surrey, have, thanks to its initiative and to private generosity, been secured for the use and enjoyment of the nation. Similarly, the Crystal Palace, the fate of which has remained dubious for so long, has become a national possession, a satisfactory ending that is due in a large measure to the generous liberality of the Earl of Plymouth.

During the past year Rothamsted—the pioneer agricultural research station—has celebrated the centenary of its founder, Lawes, and has appealed with considerable success to horticulturists for assistance in rendering its equipment yet more complete. The Cambridge School of Forestry has shown great activity during the past year; but national schemes for afforestation of suitable waste land seem to be as slow in maturing as is timber itself.

For the Royal Horticultural Society the year has been eventful and memorable. It witnessed the retirement of the president, Sir Trevor Lawrence, from the office which he had filled for so long and with such distinction, and it was the occasion of the celebration of the Rev. W. Wilks' twenty-five years of service to the society and to Horticulture. The work of the Diploma Committee, convened by the Royal Horticultural Society, has been referred to already. Another committee, called in order to advise the Council on the ways in which the Society may assist practical scientific Horticulture, has presented its report, and its findings, which cannot fail to prove of importance, are now under consideration.

To the students and lovers of "florists' flowers" the Primula Conference was the most important meeting of the year, and the Royal Horticultural Society rendered a considerable service in publishing in full the papers read at the conference.

Although no horticultural discovery of outstanding importance has been made during the year, nevertheless scientific Horticulture has made steady advances along many different lines. Of those advances, details of which are to be found in these pages, mention may be made of Mr. Pethybridge's investigations of the sexual spores of Phytophthora infestans; those of Miss Cayley at the John Innes Institution, and of J. J. Taubenhaus and Thos. F. Manns in America on streak disease of Sweet Peas; Professor Bottomley's work on the manurial value of "bacterised peat"; the contributions made by various investigators and observers on the etiology of Silver Leaf disease; and the application of electricity to the intensive cultivation of plants.

The necessity for horticultural investigations grows more apparent every year; in one department alone—that of plant pathology—there is pressing need for experiments in the destruction of such pests as Eelworm, Black Scab of Potatos, American Gooseberry mildew, big bud of Currants, Silver Leaf and Bitter Pit of Apples.

Of events of the year of general interest the most prominent is the retirement of Sir Harry Veitch, but we are happy to know that, though withdrawing from business, Sir Harry is by no means retiring from the beneficent work which he has done for so long for the advancement of Horticulture and for the benefit of aged gardeners in need of assistance.

The subtle influences of climate in every department of gardening have been responsible for many disappointments in the past season. Early spring was marked by weather conditions that baffled the most skilful cultivator in his efforts to preserve the blossom of hardy fruits, and June was a month of uninterrupted drought that from another point of view was equally troublesome. Consequently our annual report showed that the crops were less plentiful than for very many years past, Apples alone amongst the larger fruits producing anything like an average yield.

The hand of death has been heavy on horticulturists and men of science during the past year. Of the latter we have to mourn the loss of Alfred Russel Wallace and of Lord Avebury. Of the former, Mr. Amos Perry, Mr. Martin John Sutton, Mr. R. Sydenham and Mr. Edward Webb have passed away.

Our Almanac.—As a supplement to next week's issue we shall publish the *Gardeners' Chronicle* Almanac for 1914. *In order to make it as useful as possible for reference we shall be obliged if Secretaries of Horticultural, Botanical, and Allied Societies, or any of our correspondents, will send us* IMMEDIATE INTIMATION *of all fixtures for the coming year.*

NATIONAL CHRYSANTHEMUM SOCIETY.—The National Chrysanthemum Society will hold two exhibitions at the Crystal Palace during 1914, the dates being fixed for October 7 and 8, and November 4, 5 and 6 respectively. There will also be a show at the Essex Hall, Strand, on December 9, followed by a conference. The Executive Committee will meet on September 21, October 19, November 23 and December 14, whilst the following dates are fixed for the meetings of the Floral Committee :—September 21; October 7, 19 and 26; November 4, 16 and 30; and December 9.

THE CENTENARY OF THE DEATH OF PARMENTIER.—*La Vie Agricole* (No. 2, December, 1913), recalls in an interesting article the services which PARMENTIER rendered to agriculture. Born at Montdidier (Somme) in 1737, PARMENTIER died on December 17, 1813. The writer of the article, M. BALLAND, recalls the fact that this great man devoted his life to the common good. "To feed the people is my first care; my object, to improve the quality and reduce the price of food." PARMENTIER's first works were devoted to the study of plants which could be used as food in time of drought. He showed how starch could be extracted from all manner of plants, and that even when obtained from poisonous plants it may be used for food. But PARMENTIER is remembered best by his efforts to popularise the Potato as an article of diet, and a summary of his instructions for the cultivation of this plant from the pen of M. ANTOINE PARMENTIER appears in the number of *La Vie Agricole* already cited.

FLOWERS IN SEASON.—Blooms of Cyclamen latifolium of the fimbriated type are sent us by Mr. HAWKES, Osterley Park Gardens, Isleworth. Mr. HAWKES states that they are the result of several years' selection.

STREAK DISEASE OF SWEET PEAS.—The National Sweet Pea Society is offering a prize of ten guineas and the Gold Medal of the society to the first person who can prove to the satisfaction of the committee that he or she has a cure for streak disease. As arrangements are now being made for testing preventives or remedies, anyone who has discovered a cure should communicate with the secretary, Mr. H. D. TIGWELL, Greenford, Middlesex.

"THE BOTANICAL MAGAZINE."—The following plants are illustrated and described in the issue for December :—

MORENIA CORALLINA, tab. 8,527.—The Morenias are graceful Palms, closely allied to Chamædorea, and the six members of the genus are all Andine. M. corallina, which is a native of Colombia, grows from 12 to 20 feet high and bears a crown of graceful, arched leaves, each about 6 feet long. The fruits are coloured bright pink, each being about two-thirds of an inch across. The cluster of berries, as shown in the illustration, are very handsome.

GENISTA HISPANICA, tab. 2,528.—The Spanish Broom is not quite hardy, but it grows well in gardens in the South of England, and makes a good shrub for the rockery, the habit being dwarf and the dark-green shoots attractive at all seasons. In May the beautiful racemes of yellow flowers appear and then the plant is doubly attractive. The habitat is not confined to the Iberian peninsula, for wildings are met with from Portugal to Liguria, in Italy.

RHODODENDRON NIGROPUNCTATUM, tab. 8,529.—This miniature species is a native of the mountains of Szechuan, Western China, and was introduced to this country by Messrs. JAMES VEITCH AND SONS, through their collector, E. H. WILSON. It is described as the dwarfest and neatest of all Rhododendrons, and a charming plant for the rock garden. The flowers are coloured pale purple and borne either singly or in pairs. The plant grows only 10 inches high, the leaves and flowers being proportionately small.

DERRIS OLIGOSPERMA, tab. 8,530.—This plant, which has been in cultivation at Kew for more than 25 years, has proved somewhat puzzling to botanists. When first it flowered it was regarded as a new species of Wistaria and was given the name of W. involuta. As such it was described by Mr. SPRAGUE in the *Gardeners' Chronicle*, August 27, 1904, p. 141. Later, when fruits were available, it was found to belong to Derris, and was called D. involuta. But it is nearer to D. scandens and was accepted by some authorities as that plant. However, it now becomes D. oligosperma, for it is declared to be different to the true D. scandens of India and Indo-China. The plant appears to have but little horticultural value, as it is a shy bloomer, even in such favourable conditions as are provided by the Temperate House at Kew. The racemes of pale pink and white flowers are about 5 inches long.

CIRRHOPETALUM MASTERSIANUM, tab. 8,531.—This well-known Orchid has been frequently described in these pages. The plant flowers at intervals throughout the year, sending up a slender scape bearing an umbel of yellowish flowers flushed with umber brown, the lip being the most conspicuous feature.

HORTICULTURAL ACTIVITIES IN BIRMINGHAM.—At the annual dinner of the Birmingham and Midland Counties' Chrysanthemum, Fruit, and Floricultural Society, which took place a few days ago, the Treasurer, Mr. THOMAS HUMPHREYS, Curator of the Botanic Garden, Birmingham, responding for the society and its officers, stated that the association was in a healthy and safe condition. The society had been in existence something like half a century, and the financial position was satisfactory. Birmingham was in a sense unique. It had been said that it was not a horticultural centre, but it held a position possessed by no other city, with the exception of London. It had a number of societies devoted to the cultivation of particular varieties of flowers. About twenty-four years ago the Midland Carnation Society was created in the district; six years afterwards came the Daffodil Society, which was now recognised as the best of its kind in the world; then there was the Midland section of the National Auricula Society; and 99 years ago a society was formed for the cultivation of the Gooseberry. This was composed almost entirely of working men, and they did very useful work in keeping some of the finest varieties of the fruit in existence. In addition, the speaker had seen a circular relating to the probable establishment of another society devoted to the cultivation of a popular flower which could be cultivated by anyone who possessed a plot of ground. It should also be mentioned that there was in Birmingham an organisation known as the Birmingham Gardeners' Mutual Improvement Society. The receipts of their own society last year showed an increase of £58 over the previous year, of £99 over 1911, but of £67 below 1906. They were particularly anxious that next year the 1906 figure should be exceeded. The society tried to instil into the minds of the young a love of horticulture, and last year 6,000 children under the care of the Birmingham Education Committee, and from the outlying districts, visited Bingley Hall. On the second morning there were four queues, reaching from the entrance of the hall into Broad Street. Mr. HUMPHREYS made sympathetic reference to the death during the year of Mr. ROBERT SYDENHAM, who was a generous supporter of the society.

GREEN COLORATION OF WOOD BY FUNGI.—In Lower Normandy quite three-fourths of the Pear trees have their wood coloured green. The author finds that this is due to the presence of a parasitic fungus, Helotium æruginascens, which has previously been found to colour Oak and Beech wood, and also the wood of Betula alba and B. verrucosa. Another species of Helotium, H. æruginosum, occurs in similar situations and produces the same colour. Such green-coloured woods are often met with in the genera Fagus, Quercus, Castanea, Betula, Alnus, Picea, Abies, and other trees. These colouring Discomycetes were classified by Notaris under the name Chlorosplenium; but the author shows that this is not a specific genus. The C. æruginosum of Notaris is a Helotium; the C. versiforme and C. atrovirens are Coryne, and C. kriegerianum is a Rustræmia. The two species Helotium æruginosum and H. æruginascens are distinguished by the dimensions of the asci and spores. The appearance of the green colour is not an indication of disease in the trees, but rather of old age. Although it is known in France as "green rot" the term is a misnomer, for the wood is firm and hard, and its texture is in no way destroyed nor its durability affected. In fact, from its handsome permanent colour, it becomes more valuable for cabinet making and similar purposes. Probably this green Pear-wood would be valuable and much appreciated for artistic cabinet work. *P. Vuillemin* (*Comptes rend.*, 1913, 157, 323), see abstract in *Pharmaceutical Journal*, August 30, 1913.

MILDEWS, RUSTS AND SMUTS.*—This volume will prove of great service to the student of plant diseases. Whilst not attempting to cover the ground traversed by his earlier works, Mr. MASSEE has treated of the important groups—viz., the Peronosporaceæ, Erysiphaceæ, Uredinæ, and Ustilaginæ—in such a thoroughgoing manner that the student should have no difficulty in identifying species. To those who are not conversant with recent work in mycology, the large number of parasitic species which occur in certain genera—for example, in Puccinia—will appear extraordinary. Thus of the 229 pages in the present work no fewer than 70 are occupied with the synopsis of the genus Puccinia, and when it is remembered that many of the parasites of this genus—like those of other genera of rusts—attack more than one plant, a just and impressive idea of the ravages wrought by fungous-attack is evoked. We could have wished that Mr. MASSEE had included in his book a larger section of the "Pyrenomycetes." His treatment of the Erysiphaceæ is so good, and the section on the Perisporiaceæ is owing to the small number of European species so brief, that an inclusion of more of the Ascomycetes would have been most welcome. The statement on p. 129 with respect to the heterœcism of Puccinia pruni-spinosæ requires amendment. The discovery that this species of rust has two hosts was made by TRANZSCHEL. The author showed that the æcidiospores from plants of Anemone coronaria infect the Almond, and BROOKS—not BIFFEN, as stated by Mr. MASSEE—confirmed the observation by inoculating Victoria Plums with æcidiospores from the Anemone. The plates, including the coloured frontispiece, add materially to the value of this very useful volume.

---

* *Mildews, Rusts and Smuts.* By G. Massee, assisted by Ivy Massee. (Dulau and Co.) Price 7s. 6d.

THE BAMBOO GARDEN.

(See Fig. 161 and Supplementary Illustration.)

THE cultivated species of Bamboo—of which there are about 50, belonging to three genera, Arundinaria, Bambusa and Phyllostachys—are, for the most part, quite hardy except in the bleakest parts of these islands. Their decorative value is beyond question, and they possess incomparable grace and charm. Provided they are planted in a sheltered position in a rich, retentive soil, there is little doubt but that they will thrive and become objects of extreme beauty. Bamboos are especially valuable in the landscape, as one sees them in many famous gardens in the south and south-west of England and Ireland, particularly at Fota, in the south of Ireland, and in such famous Cornish gardens as Menabilly and Penjerrick, where one sees them growing into very large specimens, particularly in the case of Arundinaria Falconeri, A. Simoni, A. Kumasasa, Phyllostachys fastuosa, P. flexuosa and P. nigra. At Penjerrick there was a huge specimen of Arundinaria Falconeri, which in 1903 was over 30 feet in diameter, the centre of the plant being a solid mass of canes and over 12 feet through. In other gardens Bamboos have been collected together to form a distinct feature by themselves or combined with other Japanese and Chinese plants requiring similar conditions. Examples of these are to be found at Kew and Gunnersbury Park. At both of these places the possibilities of the Bamboo are realised to the full and shelter for the plants is provided by belts of large trees. The larger growing sorts are used as isolated specimens, whilst grouped around them or massed for effect are the smaller kinds. Some of the larger of the grasses are also included, such as Arundo Donax and its variegated form; Miscanthus japonicus and its variety zebrina, M. saccharifer, and several forms of the Pampas Grass. An avenue of Bamboos at Gunnersbury Park is a feature of these fine gardens.

Phyllostachys fastuosa, one of the tallest species, is usually of erect habit, but occasionally spreading slightly at the top. Clumps of this plant when in good condition send up canes 20 to 25 feet high. The nearest approach to this plant in height are Arundinaria Simoni and A. Falconeri, which will sometimes reach 20 feet. The former is one of the hardiest and best Bamboos in cultivation and should be included in all collections where space is unlimited. The stems are of a rich green colour, branched freely nearly down to the base and bearing a dense mass of rich Olive-green leaves. Other tall-growing species useful for making single specimens are Arundinaria Hindsii and its variety graminea; A. anceps, a real gem with erect or sub-erect stems and spreading habit; A. nitida, one of the most elegant of Bamboos with beautiful arching stems of a glaucous-grey colour, lightly clothed with pale yellowish-green foliage, inclined to be tufted in habit and forming a most beautiful object when grown as a single specimen. The plant commonly cultivated as A. nobilis in many parts of the South-West, especially in Cornwall and Devon, is the true A. Falconeri; it makes a huge specimen when grown under suitable conditions, but is too tender for general culture. Most of the specimens of this plant in the British Isles flowered a few years ago, and many years must elapse before younger plants attain to full size. Another large-sized species is A. Kumasa, the largest leaved of the hardy sorts. The habit is spreading, numerous rhizomes being pushed up sometimes a yard away from the parent clump. The stems are somewhat spreading, sparsely branched, and bearing six to ten large Olive-green leaves 10 to 12 inches long and 2 to 4 inches in diameter. The canes will sometimes run up to 10 or 12 feet high. A. Hookeriana, A. falcata and A. intermedia are tender species of large size when grown in favourable conditions, and are used frequently for decoration as pot plants.

FIG. 161.—BAMBOO GARDEN, KEW, IN SUMMER. [*Photograph by C. P. Raffill.*

Several species of Phyllostachys readily form large specimens. P. fastuosa has been previously mentioned as being the strongest-growing of all. P. Quilioi, P. aurea, P. nigra, P. Henonis and P. flexuosa form large handsome specimens, and are somewhat similar in habit and effect. Their stems arch over in a graceful manner and are green when young, but change with age to some shade of brown, and in the case of P. nigra to almost black. The foliage is of a pale yellowish-green colour and rather small. P. Quilioi var. Castillonis (P. Castillonis of gardens) is a remarkably fine plant with brilliantly variegated stems and

[Photographs by C. P. Raffill.

leaves. The stems are striated with yellow alternating with bright green, and the leaves to a lesser degree, but with rather more green. In P. viridi-glaucescens we have a strikingly distinct Bamboo, with rich Olive-green leaves glaucous-grey on the undersides, borne on slender, densely-branching canes, sometimes 12 feet high. The habit is somewhat spreading and numerous rhizomes are pushed up far away from the parent plant. It is a rapid grower and exceedingly hardy.

BAMBOOS OF DWARFER HABIT.

Numerous species of dwarf habit are worthy of note. Bambusa disticha is probably the dwarfest of all, being rarely more than 2 feet high. B. Fortunei is only known in its variegated form; it makes a fine effect when grown in a mass and varies from 1 to 4 feet high. It readily conforms to pot culture and is frequently grown for indoor decoration on account of its bright, variegated leaves and dwarf, free-branching habit. Arundinaria (Bambusa) auricoma is another dwarf plant with bright yellow-variegated leaves. A group of this species is a conspicuous object in the garden. The canes are slender, of a pale purple tint, sparsely branched and from 2 to 5 feet high.. A. Veitchii is a distinct plant having a close affinity to A. Kumasasa, but of dwarfer habit, the leaves having the curious habit of dying around the edge and forming a margin of pale brown with a dark green centre. The leaves are 6 to 10 inches long, borne on long, slender, erect or spreading, sparsely-branched stems from 2 to 5 feet high. The dead tissue of the leaves, when viewed from a distance, is most striking and effective, and has much the effect of variegation. Several other Arundinarias of dwarf habit are useful either for grouping or front-row plants. The best of these are A. pygmæa, A. pumila and A. humilis; these vary from 1 to 4 feet in height and are dark green in colour. Phyllostachys (Bambusa) ruscifolia is one of the most striking and beautiful dwarf Bamboos. It is certainly distinct from anything else in cultivation. The stems are erect and crowded together, seldom rising more than 2 feet high, even in favoured conditions, and bearing a dense mass of rich, dark-green leaves.

HINTS ON CULTIVATION.

The cultivation of Bamboos is of the easiest provided they are planted in a sheltered position in a rich soil. A rich loamy soil inclined to be heavy and retentive of moisture suits them best. Propagation is carried out either by division of the clumps, rhizomes, or by seeds. The extent to which these plants may be divided, even down to a single cane, and yet root and make a plant in a short period, is astonishing. The best times for this work are March and April if the use of a light glass structure can be obtained. For outdoor propagation one cannot be so drastic in one's methods, and one must take care to retain a fair amount of soil attached to the roots. Given the use of a well-heated greenhouse, the plants may be put into small pots, heading back the longest canes and placing them rather thickly together. Frequent syringings and abundance of atmospheric moisture are essential at this stage. A brisk heat should be maintained, and slight shade afforded until the plants are well advanced with their new growth. Little or no air should be given for some weeks after starting, as it is important to prevent the leaves and canes from shrivelling in the early stages. Once they become established they can then be gradually hardened off and eventually planted out again.

The flowering of Bamboos is rather an unusual occurrence, and in most cases is the end of the life-cycle. Most of the cultivated kinds appear to flower when about 30 years old from seed. This has proved to be the case in a number of the very finest species, such as Arundinaria Falconeri, A. falcata, A. Simoni and Phyllostachys Henonis, which flowered in British gardens between the years 1903 and 1908, and one has to deplore the loss of many fine specimens in many gardens in consequence. Seeds are produced in abundance, but are greedily devoured by sparrows; in fact, in several cases it was difficult to find a few seeds left in order to provide for the next generation. Although it is usual for the whole plant to suddenly burst into flower, several species, such as Arundinaria Hookeriana, A. falcata and Dendrocalamus strictus will flower on individual canes for a period of several years before the whole plant is involved. A large clump of A. falcata growing in the Temperate House at Kew flowered annually on a cane or two for over 10 years, then the whole plant suddenly burst into flower, ripened seeds and died.

A noticeable feature with Bamboos when about to flower is that they invariably lose the greater part of their leaves. *C. P. Raffill.*

HOME CORRESPONDENCE.

PERIODICITY OF RAINFALL.—Bruckner's weather cycle is a very old theory. Bacon, in his essay, "Of the Vicissitudes of Things," 1625, says: "They say it is observed in the Low Countries (I know not in what part) that every five-and-thirty years the same kind and suit of years and weathers come about again, as great frosts, great wet, great droughts, warm winters, summers with little heat, and the like, and they call it the prime. It is a thing I do the rather mention, because, computing backwards, I have found some concurrence." So the author of the essay on "Gardening" has forestalled the German professor. *C. Hindmarsh, 23, Nottingham Place, W.*

APONOGETON DISTACHYON.—It may be of interest to record the profuse flowering of the Cape Pond Weed, Aponogeton distachyon, which luxuriates in a large pond in the grounds of this estate. For the greater part of the year almost the entire surface of the water has been covered with the foliage and the curious, though delightfully scented, flowers of this hardy aquatic. The blooms first appeared in May and the flowering continued until late in August, when it was decided to clear the foliage and leave the surface of the water free of weed for the rest of the year. This was done in the first week of September by means of a "Dreadnought" weed cutter. To my surprise, in less than a month the water was again almost completely covered with flower and foliage, and up to the time of writing (December 16) it is still in full glory, and the rich Hawthorn-like perfume can be noticed at a distance. Three degrees of frost do not seem to have affected the plants in the least. It is interesting to note that whereas Aponogeton distachyon is generally described as a shallow-water plant, and should be planted in from 18 inches to 2 feet of water, our lake varies in depth from 2 feet to 4 feet, and is even deeper in places, while no difference can be seen in the growth or vigour of the plants, which form an unbroken sheet of flower and foliage from bank to bank. *H. F. Nobel, Castle Hill Gardens, Rotherfield, Sussex.*

PRIMULA MALACOIDES AND SKIN IRRITATION (see pp. 432, 452).—I have never known P. malacoides to affect the skin in any way whatever. I have grown the plant for many years, and this season have flowered some thousands side by side with P. obconica and have had not the slightest trouble with the skin, nor have I ever heard of it from the growers. I notice that Messrs. Bees, Ltd., received the R.H.S. Award of Merit recently for a double form of P. malacoides. It may be of interest to record that I have had several good double-flowered plants this season and of good colour. *J. F. Groves, Cambridge Nursery, Bridlington.*

LATE DESSERT APPLES.—I fully endorse all that *Southern Grower* says in favour of D'Arcy Spice (page 417) as a late dessert Apple. The flavour is first-rate, although the somewhat unattractive appearance would hardly recommend the variety for market purposes. Unlike those belonging to *Southern Grower*, our trees require but very little pruning, and they fruit well annually. This I attribute to root pruning and transplanting, operations somewhat difficult to carry out, perhaps, in extensive plantations. The fruits should not be gathered until very late (I gathered ours late in October this year), otherwise they will shrivel. As grown here the fruit keeps well into May, and I regard this variety as far superior to Duke of Devonshire. The finest late keeping dessert Apple known to me is King of Tompkins County. The Apple is of the best flavour and appearance, and I have had it good into June. The tree is of strong growth, but somewhat prone to canker; still, in localities where it will succeed it has no superior as a late dessert Apple. Lady Henniker is another late ripening variety (almost as late as King of Tompkins County) of fine flavour, while the tree grows quite free from canker. *Wilmot H. Yates, Rotherfield Park Gardens, Hants.*

SWEET PEAS TRAINED ON WIRE.—As a reader of the *Gardeners' Chronicle* for many years, and an observer of helpful and interesting ideas, I am prompted by Mr. Tuck's note on page 420 to give my experience, which may be helpful and interesting to some, of wire as an economical and new means for the training and support of Sweet Peas. Many gardeners have a prejudice against the use of galvanised wire for training plants, believing it to be harmful. I, like Mr. Tuck, have used wire for the purpose, but not wire netting. I found that tying Sweet Peas to canes took up much time when other work was pressing, so I had spiral wires made to a given size—a few at first to see how they would answer, and eventually, this year, I had all my Sweet Peas growing on them—about 450 plants in all. These wires are neater than canes, more durable, and can be purchased at the same price as canes of the same length. They are easy to put up. I place larch poles 3 inches in diameter in prepared trenches, 12 feet apart and 9 or 10 feet above the level of the ground. Two rows of Sweet Peas are planted in each trench at a distance of 12 inches apart either way. When planting is finished, I stretch three stout wires from end to end of the row, one at the top, one in the middle, and one at the bottom, making them fast at one end and slipping them through staples in the middle posts. These wires are tightened with raidisseurs, which are fastened to the posts with pieces of wire. The raidisseurs are cheap, and by their use the wire can be tightened to any extent. Eight of the spirals are fastened to the stretched wires with thin, tar twine or raffia. I fasten them in my case 6 inches apart, as I train two shoots from each plant, introducing the point of each main shoot to a spiral. Every other day the shoots are directed towards the middle of the spiral, and all side growths removed. This year the plants grew to a height of 10 feet 6 inches, showing that the wire had not hindered their progress. *James Robb, The Gardens, Woodleigh, Altrincham.*

FAILURE WITH CHRYSANTHEMUMS.—With reference to Mr. W. E. Kearn's question on p. 426 as to the failure of his Chrysanthemums to bloom, it is due, in my opinion, to errors of cultivation. In the first place, your correspondent states that he provided everything that should make a suitable compost; after enumerating ingredients (which make many a private gardener envious) he goes on to state that, the soil not being over rich, he placed a small quantity of manure over the crocks. Therein may lie the source of some of his trouble. Possibly he may have overfed the plants, inducing coarse growth, especially if the soil was not well rammed when potting. It would probably have been better for him to have commenced with a poorer compost and have fed the roots as growth proceeded. Chrysanthemums can also be overpotted, certain varieties making fewer roots than others, and having a tendency to become waterlogged. Are the plants shaded from the sun in any way? It is absolutely necessary for the wood to be ripened during the summer. Did the plants receive a check from want of water? Stopping too late is also to be guarded against. Was stopping of the shoots carried too late into

the season? If some varieties receive a check during the time the bud is forming they fail to develop the bloom. Lastly, are the plants lifted from the open ground and planted in the greenhouses? Many varieties resent this treatment, and never seem to survive the disturbance. *P. E. Cornish, Downs House Gardens, Yalding, Maidstone.*

SILVER LEAF.—In reply to *J. F. N.* (p. 426), there is no evidence of this disease being due to dryness of the soil. On the contrary, the tremendous attack of 1913 was after one of the wettest of seasons—1912-13. There is more evidence in favour of farmyard manure predisposing trees to the malady, and it would be interesting if growers of Victoria Plums would state whether they have noticed the development of the disease following closely the application of this manure. I regret that I cannot find any note of the first appearance of silver leaf in my oldest Plum orchard, planted in the autumn of 1900. In 1905 the field had a good dressing of farmyard manure; but it was not till the autumn of 1910 that I began experiments in relation to the disease. I know that previously—perhaps two or three years before—I had dug up two or three trees affected with silver leaf, and possibly I may have noticed it as early as 1907, two years after the application of the manure. The orchard had 18 tons per acre of London dung in the autumn of 1911, artificials having been used between 1905 and 1911. But no fresh trees in the orchard were affected in 1912 or 1913, I think. In the younger orchard, where I had a very much more extensive attack of silver leaf than I have had in the older one, on Victorias planted some three years and others five years, fully 17 tons per acre, partly of cow and pig manure and partly of London dung, had been applied in the autumn of 1912. This widespread attack, affecting fully one-third of the trees (one to three branches each as a rule) on half an acre of Victorias, it will be seen, followed closely the application of farmyard manure. But it also followed directly after the extremely wet season of 1912-13, and it seems to me that the wet state of the ground for months at a time is quite as likely as the manure to have encouraged the disease. Each possibly influencing factor would encourage profuse and sappy growth, and the two combined would, of course, have a double effect. Victoria is by far the most profuse grower of any among the Plums that I grow, and I believe that rank growth encourages silver leaf. The fact that grafts of Apples on trees headed back often become affected with the disease supports this impression, as all the sap that would have sufficed for the great head of a tree cut off for grafting concentrates its force upon about half a dozen scions. With respect to Mr. Taylor's suggestion as to sulphur being possibly a remedy for silver leaf, it might be tried in small doses (large ones being dangerous); but I have used superphosphate and sulphate of ammonia (with potash) almost every year, and in 1912 and 1913 I sprayed the younger orchard named above with lime-sulphur so profusely that the ground around every tree was thoroughly whitened by the wasted spray stuff. I should be more disposed to try frequent dressings of potash; but then the soil of the orchard in which I had the worst attack is heavy, and should not lack potash. Besides, it has had kainit alone or with other manures two or three times in the last five years. Now that several institutions have been endowed for experiments and research, I think we may fairly expect that a thorough investigation of this mysterious disease should be begun without delay. *A Southern Grower.*

TIMBER PRODUCTION IN BRITAIN.—In his article on "The Paris Forest Congress and British Forestry," in the *Gardeners' Chronicle* of December 6, Mr. D. E. Hutchins states, regarding the importation of timber into Britain, that "the Coast Erosion Commission of 1909 told us that we were sending some £30,000,000 a year out of the country for timber and forest products which might be produced within our borders," and he goes on to say that the evidence on which their report was founded is "conclusive reading." However grave my doubts may be as to the conclusiveness of the evidence, I have no doubt whatever about the unsoundness of the deduction which the Commission drew as to our being able to "produce £30,000,000 worth a year in timber and forest products" in this country. Why, it is more than the annual production of timber from the 34¾ million acres of forest land in the German Empire! The thing is preposterous. The annual yield in timber from the German forests (which is not, by a long way, sufficient for the country's requirements) is, according to Professor Gayer (Nisbet, *The Forester*, p. 84), about 2,120,000,000 cubic feet, worth about £20,000,000 to £22,500,000, or, on an average, about 12s. per acre; but as approximately one-third of this sum is spent on cost of management, etc., the net income per acre is somewhere about 8s. And this is got, be it remembered, from forests which are perhaps more skilfully managed than any other forests in the world. Now, supposing it were possible to afforest all the waste land in Great Britain and Ireland, in addition to the three million odd acres now under timber, it would be impossible on this basis of 12s. per acre to get a return of even one-half this amount. But it is well enough known that only a comparatively small fraction (Dr. Nisbet estimates it at about one-fifth, i.e., 3,342,156 acres, and the Coast Erosion Commission at nine million acres) of the total area of our waste land could be afforested with a fair chance of profit, so that, including what is now classed as land under timber, the total area of such profit-yielding timber land would, taking the Coast Erosion Commission's figures, amount to less than 12½ million acres, and to yield £30,000,000 annually would require to produce, not 12s. worth of timber per acre, but four times that amount, which, of course, it cannot do. Mr. Hutchins draws a comparison between timber and mutton production which, I think, will not bear examination. He seems to forget that the cost of production, rent of the land, etc., over a long period are all locked up at compound interest in the timber crop, whereas there is nothing of the kind in the case of the mutton. It does not understate, but greatly overstates, the case from the forestry point of view, though, no doubt, there are many instances where timber would give better returns than sheep-grazing. *A. D. Richardson, Edinburgh.*

JOURNEYMEN GARDENERS AND LOW WAGES.—The remarks of *A. M.* are, to my mind, somewhat sweeping. It is news to me that the average "fully-fledged" journeyman's wage is from 14s. to 16s., with bothy. In your advertisement columns of the same issue I see 18s. with bothy, etc., offered, both for inside and outside men. Occasionally one sees 19s. or 20s. offered. I admit that one sometimes sees 14s. offered for journeymen, but after the gardener has waited for several weeks, and at length engages a man, it would be interesting to know if the newcomer is equal to the improver whom the gardener already employed. My experience leads me to think that the majority of bothies are not what they were in the "Good old days"—little better than hovels—but properly constructed dwellings, and even if they are as *A. M.* asserts, only worth 3s. to 4s. per week, the upkeep of such bothies is a considerable item, especially where a large staff is employed. Times out of number I have met youths who prefer 18s. with bothy to 23s. without bothy. In conclusion, I venture to say, if it were not for the support given by private owners, half the nursery workers would have to look for their 22s. per week elsewhere. *Sidney Legg, Newstead Abbey Gardens.*

——In fairness to employers in private gardens, I feel bound to contradict *A. M.'s* statement that journeymen are paid but 14s. to 16s. weekly, with bothy, for an average of 60 hours and duty besides. Take, for example, my own employer—and I can name many others. There are eight young men in bothies, one receives 23s., one 19s., three 18s., one 17s., one 16s. weekly wage. The other, an improver, has 13s. per week, with bothy. The working hours are for summer 6 a.m. to 6 p.m., less 1½ hours for meals, for five days, and Saturdays 6 a.m. to 1 p.m., less ½ hour for breakfast. In winter, 7 a.m. to 5 p.m., and Saturdays 7 a.m. to 1 p.m., less same time as in summer for meals. I fail to see how *A. M.* can make an average of 60 hours per week. With regard to overtime duties, six have one week's duty each every sixth week, and, as usual, they assist each other on Sundays in the busy time of the year. Surely the nursery employee, with his 18s. to 22s. weekly and lodgings to pay, is no better off. So far I am convinced that the journeyman in the private garden, who has a keen interest in his work and his employer's interest at heart, has as good a chance of success as the nursery employee and those in many other occupations. *Thos. Beeson, Headley Park Gardens, Epsom.*

MEALY BUG ON VINES.—Having vines badly infested with Mealy Bug, and seeing the article by *J. H. Y.* in last week's issue respecting hydrocyanic acid gas and its efficacy, I would like to know the proportions to use in safety per 100 cubic feet. When the proportions become known generally, few, I think, would hesitate to employ the gas because of the danger, especially if it is an effective, cheap and easy remedy.—*A. J. H.* [The proportions in which cyanide may be used for fumigating dormant vines are:—Potassium cyanide, 3 ozs.; sulphuric acid (concentrated), 5 fluid ozs.; water, 8 ozs., per 1,000 cubic feet. A convenient apparatus is referred to in *Gardeners' Chronicle*, April 26, 1913, p. 280. See also *Gardeners' Chronicle*, February 17, 1912, p. 101.—EDS.]

——With reference to the note on p. 427, I have a house of Codiæums (Crotons), and the plants are infested with Red Spider. Would hydrocyanic acid gas kill the insect, and would it injure the plants in any way? If it is effective, I should be glad to learn the particulars as to the method of cyaniding, and the quantities to use in, say, three vessels.—*Spider.*

——I have read with interest the correspondence on this subject, and although I have used with success, more than once, a mixture of tar and clay as a dressing for Grape vines infested with Mealy Bug, I agree with your correspondent that the best of all methods for the destruction of that pest is hydrocyanic acid gas. I have experimented with this gas in many ways, both indoors and out, and I am quite convinced that no other insecticide is so effective as a destroyer of Mealy Bug. *J. H. Y.* says there is no danger in using the gas. I should not care to make such a bold statement, although I have done cyaniding in the way suggested by your correspondent. But would every operator have sufficient knowledge of the nature of the gas to take the necessary precautions to prevent possible accident? I am afraid not. At the same time, I am of the opinion that when cyaniding is better understood it will be much more largely employed. *J. H. Y.* states that vineries and other houses containing fruit must not on any account be "cyanided." Why not? Some few years ago I wrote to an expert asking him if it would be safe to eat Grapes after cyaniding; if so, how long after. In his reply I believe he said it would be safe to eat Grapes in less than an hour, provided the house were properly ventilated afterwards. Your correspondent speaks of keeping houses warm for a few days to hatch the eggs. I hope that he has not forgotten that this would also stimulate young female bugs to start egg-laying, unless it was very late in the season. From my experience the best plan is to paint the rods carefully with a camel-hair brush and neat methylated spirit, taking care that each nest of eggs is saturated with the spirit. After this operation the eggs will be destroyed. Cyaniding can be done before or after this operation, and may be repeated in a few days. Hydrocyanic acid gas has many uses besides the killing of Mealy Bug. It is valuable for the fumigation of nursery stock, and for use on outdoor plants, such as fruit trees. Neither spraying nor any other method is so effectual as the gas treatment. It is well known that, like the leaves of some plants, it is a matter of difficulty to get fluid sprays to wet some insects, such as Woolly Aphis, but gases enter the smallest cavities. Some light, gas-proof material is required for outdoor plants, arranged on a light framework, so that a fruit or other tree can be easily and quickly covered, and I do not see why low-growing plants like the Brassicas could not be operated on or even soil pests.

The best time to use the gas is when plants are in a dormant condition, for then there is little respiration, a condition that may be brought about by low temperatures and a dry atmosphere. *J. G. Blakey, Holmwood Gardens, Redditch.*

THE VALUE OF THATCHED ROOFS.—Farmers, landowners, and all who love the country must feel an interest in this subject; and a copy of the little pamphlet recently issued, containing a few from among many letters from persons well qualified to speak, will gladly be sent by me to anyone on receipt of a postcard. The value of thatch as a roofing for all kinds of stock is emphasised by men of the highest authority, as well as its general utility, and economy in the long run for houses, barns, and all rural buildings; while its beauty and fitness in rural surroundings cannot be surpassed. I am inclined to think that the complaint of the scarcity of men to do the work is exaggerated, for in many districts there are plenty of good thatchers, a recent Devon directory giving 123 in that county alone, and I know that they are not all old men; and, needless to say, when the demand increases, lads will learn thatching who would otherwise go into other callings. It does not seem to be generally known that Lloyd's will insure thatched buildings of stone, brick or cob at only half-a-crown per cent. This minimises an often-urged complaint; while another objection to thatch, that of harbouring fleas, etc., can, I believe, be guarded against by dressings of corrosive sublimate. I will send particulars of fire-proofing preparations or insurance at the rate mentioned above to anyone interested in the subject, and shall be glad to receive any suggestions for maintaining the use of the beautiful, serviceable, and typically English roof-covering, beneath which millions of our forefathers lived and died. The pamphlet referred to contains the signatures of prominent agriculturists, medical men, architects, and artists, and architects of the highest standing are using thatch in many parts of the country, well knowing its intrinsic value, and rejoicing in its harmony with our matchless English countryside. *L. Mark Kennaway, "St. Helens," Teignmouth.*

THE SCIENCE OF MANURING.—Manure being a very interesting subject, it follows that the *Chronicle* for November 29 is a very fascinating number, owing to the large space it devotes to manuring. It may be remarked that the toxic theory which has been advanced of recent years is by no means novel; how old, at the moment, I cannot say. And it will be remembered that Ville's *Artificial Manures* (1879) is mainly occupied by discussions on the value of potash, phosphoric acid, nitrogen and lime, Ville's contention being that other plant constituents are derived apart from the cultivator's aid. As gardeners we have to be somewhat suspicious of manuring on agricultural and even market-gardening lines. Our methods exhibit wide dissimilarities. The agriculturist stirs the soil to a depth of 4 to 10 inches, and as a rule pulverises it less finely than the gardener who cultivates to a depth of 18 inches to twice that depth. Tull's dictum that soil-pulverisation is the basis of all beneficial cultures has never been negatived. Hence, garden soil may be capable of producing fair crops for a series of years without periodical manuring. There are many instances of Strawberries having remained on the same ground for a long series of years, at least 40, without any cultivation more than keeping the plants clean by an annual digging. I myself have grown Brussels Sprouts for 15 years in succession without either manuring or digging, and on suitable soils it is possible to produce good crops of Onions year after year on the same ground. On the contrary, it is clear that the amount of manure sufficient for a farm crop is altogether inadequate for some garden crops. We see Vegetable Marrows under ordinary field culture fully as prolific as Marrows in a garden which has received many times more manure, with, perhaps, in addition, irrigation. Or, take the Onion. When we go in for large bulbs as distinguished from ordinary ones, it is not only important but essential to keep on feeding, with or without water applied, else the bulbs would fail to swell to the desired proportions. In pot cultures, were it possible to measure the amount of plant food some species not only receive but require, it would be seen to be far beyond the amount the chemist deems sufficient. There is another point about manuring worth noting. It must have been often evident to those of an observant turn that a very slight application of superphosphate or of a nitrogenous manure has set a crop agoing which showed signs of exhaustion, or at least standing still. Give each plant of a slow-moving lot of Cabbages in early March as much sulphate of ammonia as can be lifted between the thumb and two fingers, and they assume a briskness not previously evident, and once started they never stop. Or, say, Chrysanthemums in early September, which seem to have exhausted everything in their respective pots, a pinch of the same material will carry them on for weeks, restore the lack-lustre foliage to a deep green, and advance the plants to the acme of vegetable health. Surely it is not the manure as a manure that effects these remarkable changes, but rather it brings other manurial agents hitherto latent and inactive within the range of the plant's activities. Further, there is the question of root activity. I have frequently restored vigour and health to a decayed shrub growing in soil to all appearance exhausted of every item of fertility and ramified with roots by simply laying leaves round about its stem. In less than twelve months very little of the applied material was left, but evidence of an abundance of young roots, with the result of the shrub assuming a healthy appearance, making normal growth, and becoming altogether an object that one could look upon without a feeling of commiseration as heretofore. Now, were the benefits confined to the period occupied by the shrub in assimilating the food contained in the dressing there would be nothing wonderful, but when the benefit is obvious for several years is it not also obvious that the young roots instead of rendering the soil toxic to vegetation have, on the other hand, by their means opened up a store of plant food which for a time it had been unable to reach? The merest sprinkling of fine soil applied to masses of Saxifrages, Sedums, Hutchinsia, Alpine Phloxes and other dwarf plants effects in them an immediate change for the better. The little moisture-loving Nertera depressa can be kept in perfect health for an indefinite period by exactly similar means. Above all, how wonderful is it that a slight application of sand to grass causes a thickened growth of darker green. These are all instances of the immense benefit of new roots in searching for food. Those who have not tried dressing worn-out cutting boxes of bedding plants with a little soil scattered among the plants in spring will find it a ready means of proving the efficacy of new root action in promoting healthy top-growth. Potash applied to grass in a little Apple orchard I have found to be more beneficial to the grass than to the Apples, Cocksfoot (Dactylis) rising to a height of 5 feet. Rotted manure and soil spread all over the turf in another orchard has been equally good for the trees without stimulating the grasses unduly. With regard to the application of ferric oxide to Apple trees, I find its use advocated as long ago as 1868, and it will be remembered that Mr. Tonks, of Birmingham, recommended it as a cure for canker quite a number of years ago. Whether 6 feet from the stem of the tree be too near or too far depends on the age of the tree. We have trees the roots of which extend many yards beyond the spread of the branches, and a much wider circumference would need to be dressed for these to benefit them. With regard to soot, it is an excellent Carnation manure, and anyone who has applied it three or four times during the season of growth to border Carnations must have observed how healthy the plants remain, and also how it invigorates growth. That it increases the size of the flowers I should not like to say. It is of the nature of a stimulant, and therefore its application to Perpetual Carnations should cease in September because its continued use results in split calyces. It must not be forgotten that light and heat have a powerful influence on assimilation, and so in the period when direct sunlight is a factor scarcely worth considering and heat at its lowest ebb, Carnations and other plants should be very carefully nourished, perhaps never stimulated. *R. P. Brotherston.*

NATIONAL CHRYSANTHEMUM.

CONFERENCE ON OUTDOOR CHRYSANTHEMUMS.

(*Concluded from p.* 450.)

MR. THOMAS BEVAN introduced his subject by stating that he had been asked to deal with the Chrysanthemum from the point of view of cultivation for outdoor garden decoration, and to give illustrations of his methods and results.

Proceeding, he said it may be mentioned that this aspect of Chrysanthemum culture is seldom referred to by the professional grower of exhibition blooms, and is generally neglected. For more than twenty-five years I have grown a considerable number of "Earlies" for outdoor decoration, and all who have seen them have pronounced them as at least satisfactory, and to a certain extent successful. My remarks are intended for the gardener or amateur of limited space and means, and to show that a good display of Chrysanthemums can be had in the garden for at least five to six months in the year without any artificial heat whatever.

The following are the varieties used, and will be referred to again later :—

EARLY VARIETIES.—Crimson Masse, Marie Masse, Wells' Masse, White Masse, Orange Masse, Horace Martin, Ralph Curtis, White St. Crouts (October), Piercey's Seedling, Piercey's Seedling Sport, Ladysmith (October and November), The Dome, Mme. Desgrange, Mrs. Hawkins, Rose Wells, Blush Tint (single), Anastasia, Anatasia Sport (bronze), Anatasia Sport (gold tricolor), Norbet Purvey, Soleil d'Octobre, Soleil d'Octobre (bronze), Mad. C. Perrier, Nanum, Cactus, L'Ami Conderchet, L'Ami Corderchet (primrose), Goacher's Crimson, Mrs. Stacey, Mrs. Selby, Polly, Little Bob, Blushing Bride, Blush Beauty, Flora, La Petite Marie (yellow), Nina Blick, Bijou (rose), Tonkin, Kitty, Champ d'Or, Harrie, Eden, Tapis d'Or, Benjamin Guinddiam, Tapis de Niege, Mabel (apricot), Charles Jolly, Pride of Keston, Perle Rose (August), George Boness, Lillie, Howard H. Crane, Kitty (small single blush), Champagne (ruby red), Auguste, Ryecroft (scarlet), Sœur Melaine, Little Dott, Cemetery (white), Mme. Lefort, Fred Pele (these last five bloom in October), Single Red (September), Cranford Yellow, Cranford Pink (when disbudded these two bloom in September and October), Champ de Niege, Jardin des Plantes (white, July), Jardin des Plantes (yellow, July), Parisiana, White Pet, Mme. L. Lassail, Harvest Home, Single White (seedling, August), Mme. Lefort (October), Alexander Dufour (October), Dolores, Hortus Tolosanus, Almirante, Betty Spark, Carrie, Countess, Crimson Polly, Dorothy Ashley, Robbie Burns, Hector, La Neva, Le Pactole, Mignon, Perle Châtillonnaise, Pluie d'Argent, Roi de Précoces, Roi des Blancs, Verona, Canarie.

EARLY SINGLES.—A. J. Foster, A. W. Seabrook, Clarice, Ena, Firebrand, Hypatia, Joan Carter, Kate Carter, Kate Westlake, Lily Ovenden, Merstham Glory, Mrs. Earle, Parapan, Pink Gem, Richard, Snowstorm. Surrey, and W. A. Cull.

In the month of December we lift as many old stools, with mould attached, as required, cut them down to about one foot of the ground, and stand them close together against the foot of a wall, placing about one inch of light soil over them, but do not plant them in the ground. If any of the roots have much mould upon them it is not necessary to cover them with more soil, simply standing them close together. Here they remain until towards the end of February, when the necessary number of "root" cuttings are taken off, pricked into pots or boxes, and placed where some slight protection can be given to them. About the first week in April all the plants should be planted out, in about two inches of soil, in an open frame at a distance of about two inches apart each way. A garden mat should be used for protection at night and removed during the day. About the middle of May the plants should be taken up, and such as are required for specimen blooms potted singly into 48 sized pots, and afterwards stood in an open, sunny place. Soleil d'Octobre and its bronze-coloured sport, Cranford Yellow, Cranford Pink, and some others of this class are suitable for the purpose. The remainder should be planted where they are required to bloom, or set 18 inches apart in nursery beds for lifting when in flower. Those in pots should be grown on and trained to a single stem, to be planted as soon as the first break shows, with the smaller varieties either as dot plants or in rows at 2 feet apart. All side shoots should be removed, reserving only the three growths from the break, and these to be watched very closely for the first buds forming, which should be taken immediately they can be handled. If it is desired to

lengthen the season a portion of the growths may be cut off and a bud of the succeeding shoots taken a month afterwards.

The first buds are generally ready by the second or third week in June, and they will show colour in the first week of July. Several varieties, including Soleil d'Octobre and Bronze, Cranford Pink, Cranford Yellow, Polly and Goacher's Crimson were in bloom on July 20. On July 25, in addition to those mentioned, were Champ des Neige, Little Bob, Flora, Jardin des Plantes, White and Yellow Kitty and others. On August 1 second buds were taken of Soleil d'Octobre and Bronze, Cranford Pink and Cranford Yellow. On August 15 the first flowers of Wells' Masse and Soleil d'Octobre were open, with single white and red florets. On August 28, in addition to those named above, Blush Tint (single), Nanum Cactus, L'Ami Conderchet, Mrs. Stacey, Mrs. Selby, Le Petite Marie, Primrose Yellow, Blush Beauty, Mrs. J. Fielding, and others were in bloom, whilst on September 20 the first buds on Soleil d'Octobre and Cranford Yellow and Cranford Pink were fully expanded, whilst the second buds were 2 inches across, all the Marie Masse family in full bloom. After this date all the other varieties followed in quick succession.

GENERAL CULTIVATION.

One of the principal details in the successful cultivation of these plants is not to over-feed them at any time during the season, but to have the soil fairly rich, such as would grow satisfactory crops of vegetables. No artificial manure of any kind, and very little stable manure should be applied at any time, for should this be done the result will be disappointing. The wood would be coarse and the flowers loose, bad in shape, and generally overgrown.

Should the ground become so dry as to cause the plants to flag much, a copious watering should be given; a little flagging does good in checking strong growths and hardening the flowering wood. During the summer months the plants should be grown in an open, sunny situation. They should never be planted against shrubberies or in large herbaceous borders unless they are kept well away from the other occupants of the border. I recommend that the bulk of the plants grown should be set out in the nursery or kitchen garden, and about August or September lifted and planted in the flower garden in place of Pelargoniums and the usual summer bedding plants. All the Chrysanthemums can be removed and transplanted when in bloom.

Many varieties that produce flowers of only medium size can be improved by disbudding. Those of the Masse family, Goacher's Crimson, Polly, Blush Beauty, Mad. C. Perrier, Norbet Purvis, Tonkin and George Bowness are suitable for this purpose.

The small-flowering varieties, such as Little Bob, Piercy's Seedling, White St. Crouts, L'Ami Conderchet and its primrose sport, Flora, Anastasia (bronze sport), and a golden tricolor sport of my own, are all useful varieties, requiring no staking.

To make up the deficiency in colour, not attainable in the Chrysanthemum, we plant a good breadth of Aster "Melba" (deep blue), which flowers at the same time as the Chrysanthemums and lifts well.

A selection for prolonging the season can be made from both old and new varieties.

DISCUSSION.

The discussion on Mr. Bevan's paper was opened by Mr. T. STEVENSON, who spoke of the very able manner in which Mr. Bevan cultivated these flowers.

He ventured to ask the reason Mr. Bevan potted certain of his plants into 48 size pots after being planted out in frames, as he thought it would be better to keep them in the open ground all the time. He also stated that his experience with early-flowering Chrysanthemums led him to believe that after the flower buds were taken plants would assimilate benefit by more manure than those grown in pots, whereas Mr. Bevan said they required very little manure.

Mr. BEVAN stated that his reason for potting the plant at this stage was because the ground he used for planting the Chrysanthemums in the open air was usually occupied by other subjects, and the plants were simply placed in pots till such times as the ground was clear. As to the manuring question, he usually manured for the other crops that were on the ground, and found this to be quite sufficient for the Chrysanthemums.

Mr. FROGBROOK said it was very difficult to lay down hard and fast rules as to manuring, for different soils required different treatment. His own soil, which was very porous, required to be manured heavily for all kinds of plants.

Mr. HAWES, in closing the conference, said that great interest had been shown by the members in the two lectures. He thanked them for their contribution to the discussion.

COVENTRY CHRYSANTHEMUM.

DECEMBER 11.—A satisfactory report was presented at the annual dinner and meeting of the above society, held on the 11th inst. Mr. G. Griffin (secretary) gave the members details showing the position up to the present time. He said that the expenditure reached nearly £150. At the time the statement was prepared the income totalled £156 16s. 5d., and there was a small profit already on the year's working notwithstanding the record expenditure. The prize money amounted to £70 12s. 9d. Mr. Griffin referred to the increased competition in groups as a satisfactory feature of the exhibition, and in conclusion said that as the result of the show he hoped to be able to add from £8 to £10 to the society's funds. The president, Alderman A. H. Drinkwater, J.P., congratulated the members upon the excellence of their exhibition, and referred to the high opinion which the citizens had of the event. During the evening the fact was mentioned that Harold Twist, Esq., had presented the society with a handsome silver cup for competition.

DUNDEE CHRYSANTHEMUM.

DECEMBER 12.—The annual general meeting of this society was held in Lamb's Hotel on the 12th inst. The President, W. S. Melville, Esq., in moving the adoption of reports, which showed a profit on the year's working of £10 1s. 5d., said that it was so far satisfactory, but they could not hide the fact that this balance had been obtained by strenuous economy. He had already referred to the apathy of the general public in patronising the Chrysanthemum Show.

Mr. David Dickie, F. L. McGrady, D. C. Hutcheson, Alexander Mackay, and Thomas Maitland were elected Vice-Presidents, while Messrs. James Bethel and James Staward were elected members of the committee. Mr. Will F. Hill was re-elected Secretary and Treasurer. It was decided to hold the next year's Chrysanthemum Show on November 27 and 28.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

DECEMBER 8.—The monthly meeting of the above society was held at the R.H.S. Hall on the 8th inst., Mr. Arthur Bedford presiding. Five new members were elected. Four members were allowed to withdraw from their deposit account sums amounting to £15, and one member double the amount of interest, viz., £2 13s. 6d. A report on the members in permanent ill-health was read by the secretary; it was shown that one member had been on the funds for 19 years, during which time his sick pay had amounted to £268 3s., and he still had a deposit of £81 17s. 4d. Other individual members had received £213 16s., £167 18s., £145 18s., £108, £72 5s., £56 8s., £37 18s.; and £28 10s., while one member who only joined the society some six years ago had received upwards of £70 in sick pay.

BRITISH GARDENERS' (EDINBURGH BRANCH).

THE monthly meeting of this branch of the B.G.A. was held on the 8th inst. Mr. David Anderson, of College Garden, Liberton, read a paper on "The Study of Nature: Its Influence on the Lives of Men." Office-bearers for the ensuing year were elected as follows:—President, Mr. Morland, and secretary, Mr. Harris. Committee:—Messrs. Anderson, McCutcheon, Munday, Jeffs, and Stuart. The next meeting will be held on January 12, when a paper on "Spring Flowers at Belvoir Castle" will be contributed by Mr. W. H. Divers, V.M.H.

MARKETS.

COVENT GARDEN, December 23.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report.

DEBATING SOCIETIES.

WATFORD HORTICULTURAL.— The usual monthly meeting of this society was held on the 12th inst. Papers were read by Mr. E. Winsor on "Chrysanthemum Culture," and Mr. H. Newman on "Preparation of Allotments."

CHELMSFORD AND DISTRICT GARDENERS'.— The fourth meeting of the winter session was held in the Agricultural Institute on November 14. Mr. Brown occupied the chair, and about fifty members were present. The secretary read a paper written by Mr. White, of Lawford Lane Nurseries, on "Strawberries." Mr. White recommended bastard trenching of land in November for Strawberries; working again in March, and planting with Potatos, after which the Strawberries should be planted. At the meeting held on November 28 Mr. J. T. West, of Tower Hill, Brentwood, delivered an interesting and instructive lecture on "The Dahlia." The lecturer traced the history of the Dahlia, and gave reasons for the change in style from the double-flowered Cactus varieties to those of the present-day Collerette type. Mr. West also gave valuable information in respect to the cultivation of Dahlias.

DERBYSHIRE GARDENERS'.— At the annual meeting of the above association the statement of accounts showed a credit balance of £34 to carry forward to next year's account. The date of next year's Chrysanthemum Show is fixed for November 6 and 7.

BRISTOL AND DISTRICT GARDENERS'.— A meeting of this association was held on the 11th inst., when Dr. Shingleton Smith presided. The lecturer for the evening was Mr. C. Neads, representing the Newport Association, his subject being "Work in the Kitchen Garden during the Winter Months." Mr. Witt won the 1st prize offered for two dishes of Apples. A collection was made at the meeting on behalf of the Royal Gardeners' Orphan Fund.

BATH GARDENERS'.—The annual meeting was held on the 8th inst., Mr. T. Parrott presiding. The annual report showed that the Society had had a most successful year, both from a financial point of view and also from that of increased membership. The meetings had been exceptionally well attended. The winner of the Society's Silver Medal was Mr. H. Roper, with a total of 100 points. Mr. T. Allen won the Bronze Medal with a total of 75 points. The president (Mr. C. T. Foxcroft), the vice-presidents, officers and committee of the Society were all re-elected.

ELSTREE HORTICULURAL.—At the meeting held on the 11th inst. a lecture on "The Potato" was given by Mr. R. H. Ayre, of Bushey Lodge Farm, near Watford, one of the largest Potato growers in the district. Mr. E. Beckett, V.M.H., presided. Mr. Ayre placed much importance on a change of "seed" annually from the North, and the sprouting of "sets" in boxes for both early and mid season varieties. Mr. Ayre stated that he has specially constructed buildings for this purpose capable of holding many tons of seed tubers for sprouting. The lecturer stated that Epicure, Eclipse and King Edward were his favourite varieties.

BIRMINGHAM AND MIDLAND GARDENERS'.—The autumn session of the above society concluded on the 17th inst. The evening was devoted to the discussion of various questions raised by the members. The questions elicited much valuable information. Spot on Orchid leaves was declared to be due to an excess of moisture in the house. The question of Red Spider on Cucumbers was discussed, and the best means of destroying the pest was stated to be a mixture of soft soap and sulphur: a damp atmosphere is inimical to the pest. One enquiry was, "How Ferns are crossed in order to produce new varieties." Messrs. Christie and Palmer were re-elected auditors.

GARDENING APPOINTMENTS.

[*Correspondents are requested to* **write the names of persons and places as legibly as possible.** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

Mr. W. Thomas, for 4 years Gardener to E. C. MEYSEY-THOMPSON, Esq., M.P., Spellow Hill, Knaresborough, Yorkshire, and previously in the Gardens at Clumber and Kedleston, as Gardener to G. E. STRINGER, Esq., Barton Seagrave Hall, Kettering, Northamptonshire.

Mr. F. H. Paulley, for the past 7 years Second Gardener to the late Mrs. HOOPER, Thorne House, Thorne, Yeovil, as Gardener to G. F. DEEDES, Esq., The Wash, West Coker, near Yeovil, Somersetshire.

Mr. Fred Tidman, for the past 5 years and 8 months Inside Foreman at Mote Park Gardens, Maidstone, Kent, and previously at Byrkley Lodge Gardens, Burton-on-Trent, Woodside Gardens, Darlington, and Newby Hall Gardens, Ripon, Yorkshire; as Gardener to GOODWIN HALL, Esq., Manor House, Alton, Hampshire.

Mr. William Jones, Gardener to the late Sir THEODORE MARTIN, afterwards in the service of the Trustees at Bryntysilio, Llangollen, as Gardener to GEORGE HARRISON, Esq. at the same place.

Mr. F. J. Brown, for the past 12 years Gardener at Cold Overton Hall, Leicestershire, as Gardener to MAJOR DUBERLY, Gaynes Hall, St. Neots, Huntingdonshire. [Thanks for 1s. for R.G.O.F. box.—EDS.]

Mr. T. W. Birkinshaw, for the past 9 years Gardener to Sir CHARLES HAMILTON, Bart., Hatley Park, Sandy, Bedfordshire, as Gardener to Colonel HORNSBY-DRAKE, Compton Bassett, Calne, Wiltshire.

Mr. Evan G. Jones, for 14 years Gardener at Homestall, Barley, Royston, Hertfordshire, as Gardener to Mrs. TAYLOR, Stoney Ware, Marlow, Buckinghamshire. [Thanks for 1s. for R.G.O.F. box.—EDS.]

Mr. J. Hextall, for the past 3½ years Gardener at Terrick House, Butler's Cross, Buckinghamshire, as Gardener to Colonel GOODALL, Dinton Hall, Aylesbury, Buckinghamshire.

Mr. David Smith, for 8½ years Gardener at Lanrick Castle, Doune, Perthshire, as Gardener to City of Leeds Training College, Yorkshire.

Mr. F. T. Rose, for two years Gardener to Sir BACHE CUNARD, Bart., Nevill Holt, Market Harborough, as Gardener to W. O. CARVER, Esq., Cranage Hall, Holmes Chapel, Cheshire. [Thanks for 1s. 6d. for the R.O.G. Fund.—EDS.]

Answers to Correspondents

"There are few gardeners, and still fewer amateurs, who do not on occasion require immediate information upon various points of practice. But either from an unwillingness to inquire, or from not knowing of whom to make the inquiry, they too often fail to obtain the information they are in want of. And let no one be alarmed lest his questions should appear trifling, or those of a person ignorant of that which he ought to know. He is the wisest man who is conscious of his ignorance; for how little do the wisest really know!—except that they know little. If one man is unacquainted with a fact, however common, it is probable that hundreds of others in the same position as himself are equally in want of similar information. To ask a question, then, is to consult the good of others as well as of one's self."—*Gardeners' Chronicle, No. 1, Vol. I., January 2, 1841.*

A MONSTROUS RIBES.—*W. C.* The malformation of the shoot of Ribes is remarkable. The main shoot has produced tufts of innumerable branchlets, which are crowded together after the fashion of those in witches' broom. There can be no doubt but that the monstrous growth is due to damage of the growth-forming tissues of the plant, and the extent of the malformation suggests that the damage was not produced by mechanical but by chemical means. This chemical damage—or poisoning—may be ascribed with certainty to some parasitic organism, either an insect or a fungus. Thus the malformation falls into line with witches' brooms and galls generally, which are due to the toxic action of a parasite on the formative elements of the plant. The illustration (fig. 162) shows a witch knot on Birch, caused in this case by a minute four-legged Acarus (Phytoptus), very similar to the one causing Big Bud in Black Currant.

FIG. 162.—WITCH KNOT ON THE BIRCH.

BEECH DISEASED: *J. V., Derby.* The Beech Coccus is often confined to the trunk and main branches of the tree, when it can be eradicated by scrubbing the bark with a strong insecticide. In other cases scrubbing may not be practicable, and you must then resort to spraying. The following treatment is recommended by the Board of Agriculture:—(1) The trees should be sprayed, when in the dormant condition, with the following emulsion-soda wash, as used at the Woburn Fruit Farm: Paraffin, 2 gallons; soft soap, 1½ lb.; caustic soda (98 per cent.), 6 lb.; water, 28 gallons. In order to prepare the wash the soft soap should be dissolved in a gallon of boiling water; the paraffin should then be added, and the mixture churned thoroughly until a cream-like mass results. The thoroughness of the churning is important. The 6 lb. of caustic soda should next be dissolved in the remaining 27 gallons of water, and then poured into the paraffin emulsion. The whole should be well mixed and used immediately. Experimental work at Woburn, however, indicates that there are advantages in using a wash composed of: Sulphate of iron, ½ lb.; lime, ¼ lb.; paraffin (solar distillate), 5 pints; caustic soda (98 per cent.), 2 lb; and water to make 10 gallons. This may be prepared for use by proceeding as follows: (*a*) Dissolve the sulphate of iron in about nine gallons of water; (*b*) shake the lime in a little water, and then add a little more water to make into a "milk"; (*c*) run (*b*) into (*a*) through a piece of coarse sacking to remove grit; (*d*) pour the paraffin into the mixture (*c*) and churn the whole thoroughly; (*e*) add the caustic soda in powdered form just before using, and stir thoroughly. In using either of these mixtures the face and hands must be protected, as the mixtures are caustic in character. One advantage of the caustic soda is that it helps to clear the tree of such growths as lichens and algæ.

CYANIDING VINERIES: *W. H. P. and C. M.* See note in "Home Correspondence," p. 462.

FORCING: *W. L. F.* To maintain a continual supply of bulbous and other forced flowers it is necessary to place a fresh batch of plants in heat every week. Daffodils should not be plunged directly in strong bottom heat, but grown first for about a week in an atmospheric temperature of 55° to 60°. Rhododendron sinense (Azalea mollis), Lilacs, Viburnums and Wistaria may now be forced with satisfactory results. Clumps of Anchusa italica, Dropmore Variety, should be lifted from the open ground, potted, and placed in a cold frame or vinery until they start into growth, when they should be brought into a greenhouse. Pæonies may be lifted and treated in much the same manner as Anchusas

GRAPES SHANKING: *A. B.* You ask what is the cause of shanking. There are many causes, but they all operate in the same way by bringing about a state of partial starvation at a critical time. A border containing too much nitrogenous matter in the early stages of the vine's existence will produce gross growth composed of large cells, which are inadequately filled with mineral and other matter, and consequently partially collapse at the time of ripening, when much of the water which has hitherto kept them turgid, is withdrawn. As hardening takes place at the same time, the original form is never regained, and flattened, ill-shaped stems are the visible sequence, telling of internal obstruction. This is a frequent cause of shanking. Vine rods should be circular in form, as they will be if the feeding is faultless and all the leaves are produced in abundance of light, with no excess of heat during nights or dull days, nor of atmospheric humidity at any time. Another cause of shanking is want of aeration in the border owing to heavy mulchings, especially whilst the roots are inactive, or excessive damping when the roots are inside the house. Outside borders are sometimes cropped with vegetables or flowering plants, and many of the feeding roots are annually cut off with the spade. Or, again, it may be, as in the case of inside borders, too much mulching is applied. We have examined borders in which the soil had the consistency of liver, which took twelve months' exposure to the weather before becoming pulverised, yet the vines still lingered. Sometimes the roots, which are supposed to be confined to a prepared border, even if inside, may be found with their principal feeders in the vegetable quarter 40 feet or more away, where, if near the surface, they are doomed to periodical amputation. A good coating of cement will prevent them penetrating a wall, but bricks and mortar will not do so, and if there is a deficiency of lime in the border, they will enjoy feeding on the mortar. Another cause of shanking may be found in the mismanagement of growths, such as neglect of early stopping, followed by taking off too much foliage, thereby causing the growths to become hide bound and thus preventing circulation for a time. If this happens during the flowering period, it will prevent perfect fertilisation, which in itself is apt to produce shanking, though it may not be apparent before the stoning period or even later. Shanking may also be caused by too high temperatures at night before root action commences, which is always later than leaf action; by insufficient healthy foliage, by foliage so crowded that much of it cannot be reached by the sun's rays, or by a large proportion of foliage pressing against the glass, where it is alternately scorched and chilled. The trouble is sometimes caused by over-cropping, especially when the vines are young, and in this case they seldom recover, also by insufficient phosphoric or potassic manure, by a want of good drainage, which helps to aerate the soil and make it warmer, in fact, anything which prevents either the roots or leaves doing their part in feeding and assimilation will conduce to shanking. The malady may be ameliorated by lifting the roots and placing them in fresh soil, but it takes some time to effect a cure, and in bad cases it is best to start afresh with a new border and young vines. Where there is only one house it is sometimes advisable to renovate half the border and replant half the vines at one time.

NAMES OF PLANTS.—*J. D.* 1, 2, and 6, Cupressus Lawsoniana var.; 3, Juniperus chinensis; 4, Cupressus nootkatensis; 5, Thuya dolabrata.

PANDANUS VEITCHII: *L. D.* Old plants that have been used for decorative purposes in the dwelling-rooms and have become disfigured may be used for purposes of propagation. Select the best coloured side shoots or suckers and insert them singly in thumb pots filled with suitable soil. They will root in a gentle bottom heat in the stove or propagating pit. The old plants may be afterwards discarded.

PARK SUPERINTENDENTS AND DIRECT CONTROL.—Since the paragraph printed on p. 443 was published information has reached us to the effect that the superintendents of the parks in the following towns are directly responsible to the committee:—Birmingham, Bridlington, Cardiff, Dewsbury, Edinburgh, Glasgow, Leamington, Leeds, Southport and Stockton-on-Tees.

PEAT MOSS LITTER.—*J. H.* The material would be suitable for your purpose, especially as it is enriched with the fowls' manure.

RAISING AND PLANTING MELONS.—*H. J. G.* Sow the seed about the middle or end of January singly in 3-inch pots, in the manner described in your note, and grow the seedlings near to the roof-glass. Shift the young plants before they become pot-bound into 6-inch pots, using one part of horse droppings to about five parts of the loam you mention as a compost. When the plants have made about 15 inches of top growth they should be set in mounds of soil formed at 2 feet apart, and consist of five parts loam and rather more than one part of horse-manure and old lime-rubble or wood-ash. Place a thin layer of brickbats, clinkers, or coarse gravel over the stage for drainage, and on this some half-rotten stable litter. Set the plants one on each hillock the same depth in the soil as they were in the pots, pressing the soil quite firm. Train the plants up to the fourth or fifth wire before stopping them. In the meantime laterals will have developed regularly from either side of the stems. Remove the first fruits from the bottom laterals to ensure a regular set of fruit on each plant. When it is seen which are the best to leave, remove the others. Stop the fruit-bearing shoots at two joints beyond the fruit, pinching out the sub-laterals and all superfluous growths as they appear to prevent crowding of the shoots. As the roots push through the sides of the mounds a few inches thick of the aforementioned compost should be added, continuing to make such additions until the intervening spaces are filled up to within an inch or two of the top of each hillock. It is not wise to bury the stems of Melon plants in the soil when planting or top-dressing them, as is generally and properly done in the case of Cucumbers, as canker would then attack the collar of the plants. The composition of your soil for Cucumbers is suitable. The atmospheric temperature observed in your Cucumber houses will answer the requirements of the Melons, except when the plants are in flower, and again when the fruits are approaching maturity, when a somewhat dry and airy atmosphere should be maintained.

VIOLETS DISEASED.—*Constant Reader.* The plants are affected with the "spot" disease. See note from Mr. Spinks in the last issue, p. 449.

CUTHBERT'S SPECIALITE MUSHROOM SPAWN.—NEW SPAWN NOW READY. We continue to receive the most gratifying testimonials as to the productiveness and good quality of our Spawn. Per bushel, 5s.—R. & G. CUTHBERT, Seed and Bulb Merchants, Southgate, Middlesex.

NOBLE Foliage for covering Pergolas, Old Trees, Buildings, etc. Plant now Grape Vines and Ivies, 7 feet high, from large pots; 2s. 6d. each, 27s. dozen.—WILL TAYLER, Hampton, Middlesex.

SALES BY AUCTION.

By Order of the Court.

MESSRS. H. C. CANNELL & SONS' NURSERIES,
SWANLEY JUNCTION, KENT.

Important Clearance Sale of the whole of the Stock-in-Trade.

THE GOODWILL OF THE BUSINESS HAVING BEEN DISPOSED OF,

MESSRS. PROTHEROE & MORRIS will SELL by AUCTION, on the Premises, Cannell's Nurseries, close to Swanley Junction Station, on

Monday, July 14, and two following days, at 12.15 o'clock,

in suitable lots, the whole of the well-grown Stock, including

20,000 PELARGONIUMS and GERANIUMS,

consisting of the best-known varieties, many having been raised at these Nurseries, and amongst them the whole of the Stock Plants.

8,000 BEGONIAS,
25,000 CALCEOLARIAS and CYCLAMEN,
5,000 FUCHSIAS,
3,500 CANNAS.

Also Stocks of CHRYSANTHEMUMS, DAHLIAS and CARNATIONS. The above are nearly all named plants, and comprise the collection of varieties raised or brought together after so many years' experience by the firm of Cannell and Sons, and exhibited so successfully at the principal Shows. STOVE and GREENHOUSE PLANTS in great variety. Roses in pots. 15,000 ALPINE and HARDY PLANTS in pots.

Quantities of young stock for growing on. The remaining stock of SEEDS, including the 1913 saved Primula, Cineraria and Cyclamen seed.

May be viewed one week prior to sale. Catalogues had on the premises; of Messrs. Stones, Morris and Stone, Solicitors, 5, Finsbury Circus, E.C.; Messrs. Child and Son, Chartered Accountants, 8, Fredericks Place, E.C.; and of the Auctioneers, 67 and 68, Cheapside, E.C. Arrangements can be made for packing and despatching any lots purchased to all parts of the Kingdom.

N.B.—The Horses, Vans, Tools, Utensils and Sundries will be sold on the premises the following week.

The Nurseries, see separate advertisement.

TENDERS.

PARISH OF BERMONDSEY.
The Guardians of the above-named parish invite TENDERS for the PURCHASE of HOT-WATER PIPES and CONNECTIONS, in good condition, removed from the wards at the Infirmary, Lower Road, Rotherhithe, S.E., in consequence of another system of heating being adopted.

Forms of tender (which only can be received), containing full particulars and conditions, may be obtained on written application to me, enclosing a fully-stamped addressed foolscap envelope.

The pipes, &c., referred to can be seen at the Infirmary, Lower-road, Rotherhithe, S.E., between the hours of ten a.m. and one p.m. any week day.

Tenders to be delivered to me at my office, not later than the 12th July, 1913.

By order.
E. PITTS FENTON, Clerk to the Guardians.
No. 283, Tooley Street, S.E., 26th June, 1913.

COUNTY BOROUGH OF HALIFAX.

THE PARKS COMMITTEE of the HALIFAX CORPORATION invite tenders for the supply of Dutch and other Bulbs and Flowering Roots for the Parks. Forms of tender and quantities may be obtained on application to Mr. Herbert Tate, F.R.H.S., Parks Inspector, Belle Vue, Halifax. Tenders, endorsed "Bulbs," must be sent to the undersigned on or before Friday, July 18, 1913. The person whose tender is accepted will be required to observe the fair contracts clauses adopted by the Corporation. The Committee do not bind themselves to accept the lowest or any tender.

By Order,
PERCY SAUNDERS,
Town Clerk.

Town Hall, Halifax, July 2, 1913.

A huge success

in stirring up business, and breaking new ground. The right vehicle for enterprising firms.

The HILLMAN MOTOR WAGGON

To carry 10 to 12 cwts.

The following facts supplied by an independent private user. The original letter may be seen if desired:—

"We are very pleased to be able to express our entire satisfaction with the 10 h.p. van we purchased from you some weeks ago, and owing to its continual and reliable service, our business already feels the benefit of motor traction in place of horses. The motor van, although fitted with a rather heavy body, is very easy to handle and runs on an average 25 miles to a gallon of petrol. Most of our journeys are between Coventry and Birmingham with loads up to twelve cwt., and the van does the single journey of 18 miles usually well within the hour, and on its return is ready for the daily delivery of goods. We feel sure that as soon as your 10 h.p. commercial car becomes known, you will experience a very big demand for it."

The HILLMAN is supplied fully guaranteed. Absolutely dependable, economical, and durable. The design is simple and accessible, so that the vehicle can easily be kept in thorough order.

Very easy to drive.

Full particulars promptly sent, post free.

Address all communications to:—

THE HILLMAN MOTOR CAR Co., LTD., PINLEY WORKS, near COVENTRY.

Forces earlier than Sovereign, a better colour and flavour. Fine size and cropper. Pot plants £2 100.

Read the following testimonials:—

Mr. Modral, Old Warden Park.—"I find your King George V. a most excellent forcer—four or five days earlier than Sovereign, a better colour and flavour, similar in growth, but more vigorous."
Mr. Butcher, Lincoln.—"Delighted with King George. Best strawberry for forcing I ever had."

Early pot plants of Royal Sovereign and others from maiden plants 16/- 100.

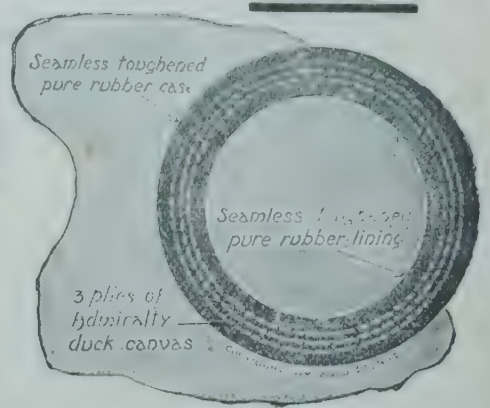
GARDEN HOSE. "RHINOHIDE" BRAND.

This Hose is built to our special specification from the purest materials, without the admixture of any makeweights whatever; colouring matter is even excluded, preserving the natural light grey colour. The inner lining is SEAMLESS, of the purest toughened rubber procurable, thoroughly frictioned to and covered with three plies of ADMIRALTY STANDARD Quality Duck Canvas, the whole encased in the outer cover of purest toughened rubber. The ends of each length are rubber sealed, uniting the inside lining and outside cover, preventing any moisture or grit working into the plies. With absolute confidence **we claim this to be**



The Best Hose in the World
and back it with **10 Years' Guarantee.**

PRICES. Carriage Paid to Railway Station.

	Internal diam. ¼-in.	⅜-in.	½-in.	1-in. (3-ply).
Rhinohide Hose	***1/-***	***1/2***	***1/4***	***1/9***

(Per foot run in 60-ft. lengths).

Huge Stocks Held.
So confident are we in this Hose that we have put into stock unprecedented quantities.

Orders Railed Same Day.
No waiting unless special fittings have to be made.

Better than Armoured Hose.
Lasts longer; no rusty wire; no cutting up of lawns and paths.

MARKETS.

COVENT GARDEN, June 25.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—The last of the Australian and Tasmanian shipments of Apples have arrived for the season. Sturmer Pippins form the bulk of the varieties unsold from these sources. Large supplies of Strawberries from Kent and Middlesex are arriving in Covent Garden daily. Supplies of Cherries from Kent are much larger than was anticipated. Good samples of Black Currants are arriving from Kentish growers, also from the Continent. Red Currants are also sent by Continental growers. Raspberries are very plentiful. There is a fairly good supply of both Figs and Melons. Larger quantities of Grapes from both English and Continental growers are available. Supplies of Peaches and Nectarines have been about equal to the demand. English Tomatos are very plentiful. English Asparagus is still available, and there is a full supply of Mushrooms. Other vegetables are plentiful. *Edgar H. Rides, Covent Garden, July 2, 1913.*

New Potatos.

REMARKS.—New Potatos from St. Malo and Jersey will soon be finished, but the supplies from Bedford, Essex and Kent are much larger. Trade is very steady at the prices quoted above.—*Edward J. Newborn, Covent Garden and St. Pancras, July* 2, 1913.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending June 28 is furnished from the Meteorological Office :—

GENERAL REMARKS.

Weather.—Over the kingdom generally the weather was more or less cloudy, but rain was infrequent except in the North and East of Scotland. Thunderstorms or thunder only occurred in isolated parts of Scotland, Central and Eastern England, about the middle of the week, and thunder was heard at Margate on Saturday.

Temperature was below the normal, the difference amounting to about 3.5° in Ireland. The highest of the maxima were recorded in most districts on the 28th, but at many stations in the North-east and North of England, and in some parts of Scotland they occurred more commonly on the 22nd. The values ranged from 77° in the Midland Counties and 76° in England East and South-east, to 66° in Scotland North and West and Ireland North. The lowest of the minima, which were recorded on irregular dates, varied from 40° in Scotland East, England South-west, and Ireland North to 47° in England North-west and the English Channel, and to 48° in Scotland West. The lowest grass readings were 30° at Wisley, 31° at Dublin (Phœnix Park), at Markree Castle, and 35° at Cullompton. In a few localities the temperature of the soil was below the average at a depth of both 1ft., and also at 4ft., but generally it was a little above the normal.

Rainfall was less than the average except in Ireland North. At several stations in the Southern and Central Counties of England the fall was less than 0.1 inch. At Donaghadee on the 24th there was as much as 1.1 inch.

Bright sunshine exceeded the normal in the South-West of England and the English Channel, but was below it elsewhere, the deficit being considerable in most parts of the Kingdom. In the English Channel the mean daily duration was 9.7 hours, and in England South-West 7.8 hours, the percentage of the possible duration being respectively 61 and 48. In Scotland North the mean daily amount was 1.6 hours, only 9 per cent. of the possible.

THE WEATHER IN WEST HERTS.

Week ending July 2.

The third dry week in succession.—Taken as a whole, this was a week of about average temperature. On the warmest day the temperature in the thermometer screen rose to 77°, and on the one cold night the exposed thermometer fell to within 4° of the freezing-point. The ground is now 1° warmer at 2 feet deep, and 2° warmer at 1 foot deep, than is seasonable. There was a trifling fall of rain on the morning of June 25. For over three weeks the weather has been very dry—in fact, during that time only about one-tenth of an inch of rain has fallen. During the same period no rain at all has come through the 2½ feet of soil in either of the percolation gauges. The sun shone on an average for 6½ hours a day, which is a quarter of an hour a day longer than the mean duration for the end of June. Light airs and calms have alone prevailed during the week, the direction of those light airs being principally from some point between west and north. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 9 per cent. *E. M., Berkhamsted, July 2.*

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

THE SYCAMORE WORKS CO.,

Hothouse Builders and Heating Engineers, WIMBLEDON.

EST. 1870.

IMPORTANT

Before placing orders for Hothouse work, write for our representative to call and take particulars of your requirements. We will then post you plans, specifications, and estimates, for which we make no charge whatever, business resulting or not. We build good, sound greenhouses which last, all work undertaken by us being carried out by highly skilled workmen on TIME rates only, and NOT by the unsatisfactory piece-work system.

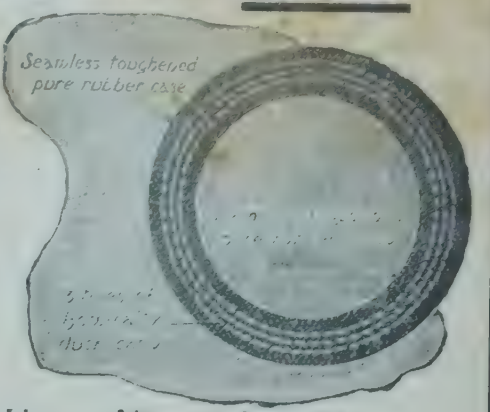
GARDEN HOSE. "RHINOHIDE" BRAND.

This Hose is built to our special specification from the purest materials, without the admixture of any makeweights whatever; colouring matter is even excluded, preserving the natural light grey colour. The inner lining is SEAMLESS, of the purest toughened rubber procurable, thoroughly frictioned to and covered with three plies of ADMIRALTY STANDARD Quality Duck Canvas, the whole encased in the outer cover of purest toughened rubber. The ends of each length are rubber sealed, uniting the inside lining and outside cover, preventing any moisture or grit working into the plies. With absolute confidence **we claim this to be**



The Best Hose in the World

and back it with **10 Years' Guarantee.**

PRICES. Carriage Paid to Railway Station.

	Internal diam. ¼-in.	½-in.	¾-in.	1-in. (3-ply).
Rhinohide Hose	***1/-***	***1/2***	***1/4***	***1/9***

(Per foot run in 60-ft. lengths).

Huge Stocks Held.
So confident are we in this Hose that we have put into stock unprecedented quantities.

Orders Railed Same Day.
No waiting unless special fittings have to be made.

Better than Armoured Hose.
Lasts longer; no rusty wire; no cutting up of lawns and paths.

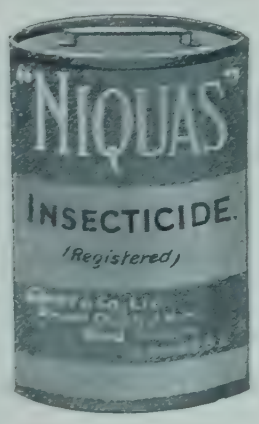
IMPORTANT TO GARDENERS AND FRUIT GROWERS.



"NIQUAS"

IMPROVED.

(Registered).

The most successful Non-poisonous Insecticide of the day.

ITS ADVANTAGES ARE—

Certain death to all Insect Pests.

No possible injury to the most delicate Plant, Flower, or Foliage.

It is by far the cheapest Insecticide known. One pint makes ten to twelve gallons for Thrip, Black and Green Fly, etc. whilst RED SPIDER, Mealy Bug, and Scale can be thoroughly eradicated by using **"NIQUAS,"** about double the strength required for Fly.

It is most successfully used by Orange and other Fruit Growers in the Colonies, etc.

PRICES:—Half-pint, **1/-**; Pint, **1/6**; Quart, **2/6**; ½-Gallon, **4/-**; Gallon, **7/6**; Kegs, each 5 gallons, **25/-**; 10 Gallons **45-**.

Ask for Testimonials, of which some hundreds have been received.

SPECIMEN TESTIMONIAL.

From Mr. E. HUBBARD, Gardener to G. Hanbury, Esq. Blythewood, Burnham, Bucks. May 15th, 1906.

"I have been using your **'NIQUAS' Insecticide** for some years, and can with all confidence say it is the best I have ever used for Bug, Thrip, Red Spider, American Blight; and for all Insect Pests it has no equal. Also for the destruction of Maggots in Marguerites by dipping. I have recommended it to my friends generally."

To be had from all Seedsmen and Florists.

Manufactured by CORRY & CO., Ltd.

MARKETS.

COVENT GARDEN, July 9.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Vegetables: Average Wholesale Prices (cont.)

REMARKS.—The only dessert Apples obtainable are Tasmanian Sturmer Pippins. Supplies of Strawberries show a considerable decrease, but Raspberries, Currants, and Loganberries are plentiful. French and Dutch growers are contributing fairly large supplies of both Black and Red Currants. Apricots from Continental sources have been scarce during the past week. Cherries, both English and foreign, are plentiful. Waterloo is the best of the English dessert varieties. Peaches and Nectarines are fairly numerous. Green Figs and Melons, especially the Cantaloupe variety, are much more plentiful. There are good supplies of all varieties of Grapes. The earliest consignments of Continental Gages and other Plums are arriving in Covent Garden Market. Heavy supplies of Tomatos are arriving daily from all sources. The market is well supplied with all kinds of vegetables in season.—*Edgar H. Rides, Covent Garden, July 9, 1913.*

REMARKS.—The Potato trade is somewhat dull; the supply of tubers is quite equal to the demand.—*Edward J. Newborn, Covent Carden and St. Pancras, July* 10, 1913.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 5, is furnished from the Meteorological Office :—

GENERAL REMARKS.

Weather.—In the earlier half of the week the weather was fine and dry over the United Kingdom generally. Later on the conditions became less settled in the north and east, and by the end of the period changeable, showery weather had extended to all but the south-western districts. Thunder was heard at West Witton on June 30, and at Dover on July 1 and 2.

Temperature was considerably below the average in England E., and slightly below it in most of the other English districts, as well as in Ireland N. and the English Channel. In Scotland and in England S.W. and Ireland S. it was above the normal. The highest readings occurred mainly on June 29 or 30 in the English districts, but later in the week in Ireland and Scotland; the actual readings ranged from 83° in England S.E., and 82° in England S.W., to 74° in Scotland W., and to 73° in England N.E. On July 4 the thermometer at many stations failed to reach 60°. The lowest of the minima, which occurred at times varying greatly in the different districts, ranged from 42° in England S.W. to 48° in Scotland N. and England S.E., and to 51° in the English Channel. The lowest grass readings reported were 34° at Dublin (Phœnix Park), 35° at Llangammarch Wells, and 37° at Wisley. The temperature of the soil was as a rule above the average, but at some places in the east and north-east of England the readings of the thermometer at a depth of 1 foot were slightly below the normal.

Rainfall was considerably less than the average. In most of the western districts the total amounted to less than 0.10 in., and at several stations in England S.W. and Ireland S. the week was rainless.

Mean Temperature of the Sea was a little above the normal, but on many parts of our western and northern coasts it was lower than in the corresponding week of last year. The mean values ranged from 63.8° at Seafield and 61.7° at Eastbourne to a little below 51° at Wick and Burnmouth.

THE WEATHER IN WEST HERTS.

Week ending July 9.

A very cold, dry, and sunless week.—The past week was decidedly cold for July. In fact, the highest day temperatures in the thermometer screen were all from 6° to 10° below the average maxima for the time of year. On the coldest night the exposed thermometer fell to the freezing-point—the lowest reading recorded here in July since 1886, or for twenty-seven years. The ground temperatures have consequently fallen, and are now 3° colder at 2 feet deep, and 5° colder at 1 foot deep, than is seasonable. Small amounts of rain fell on four days, but to the total depth of only a quarter of an inch, and yet we have to go back five weeks in order to find one with as much rain even as that. Since June 8 less than half an inch of rain has been deposited. That the ground must have now become unusually dry is shown by the fact that no percolation at all has come through the 2½ feet of soil in either of the percolation gauges for over four weeks. The sun shone on an average for only two hours a day, which is four-and-a-quarter hours a day short of the usual duration for the same period in July. There were four consecutive days when less than half an hour's sunshine was recorded. Calms and light airs alone prevailed during the week—the direction being exclusively from some point between north and west. The mean amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by 9 per cent.

Organised by the

CERCLE HORTICOLE VAN HOUTTE.

For all information apply to the Secretary—

F. SPAE, MELLE-GAND, BELGIUM.

CATTLEYA AUREA.

A special collection of very fine semi-established unflowered Plants of this grand Cattleya, with large flowering sheath, ready to bloom. All the Plants offered are in a fine healthy condition, and grown to perfection.

I have myself collected these Plants, at a great expense, in an entirely New District, where I gathered a small number four years ago. It has proved to be a greatly superior type to those introduced up to the present. Many fine forms from this same importation have flowered, amongst them Cattleya aurea "ROSITA" and many grand forms of Cattleya "HARDYANA." I am convinced that many others equally good will be found amongst the Plants I am now offering. Cattleya aurea has now become exceedingly rare in its native habitat. Amateurs would do well to avail themselves of this exceptional opportunity. *Particulars and prices on application.*

A. MUESSER, Orchid Importer and Grower, WOLUWE-ST.-LAMBERT (BELGIUM).

CALENDAR OF GARDEN OPERATIONS.

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

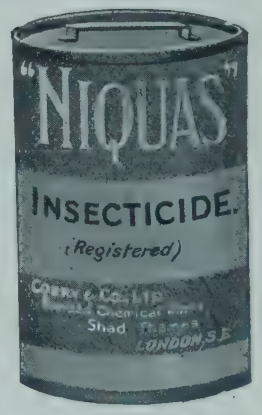
IMPORTANT TO GARDENERS AND FRUIT GROWERS.



"NIQUAS"

IMPROVED.

(Registered).

The most successful Non-poisonous Insecticide of the day.

ITS ADVANTAGES ARE—

Certain death to all Insect Pests.

No possible injury to the most delicate Plant, Flower, or Foliage.

It is by far the cheapest Insecticide known. One pint makes ten to twelve gallons for Thrip, Black and Green Fly, etc., whilst RED SPIDER, Mealy Bug, and Scale can be thoroughly eradicated by using **"NIQUAS,"** about double the strength required for Fly.

It is most successfully used by Orange and other Fruit Growers in the Colonies, etc.

PRICES:—Half-pint, **1/-**; Pint, **1/6**; Quart, **2/6**; ½-Gallon, **4/-**; Gallon, **7/6**; Kegs, each 5 gallons, **25/-**; 10 Gallons **45/-**.

Ask for Testimonials, of which some hundreds have been received.

SPECIMEN TESTIMONIAL.

From Mr. E. HUBBARD, Gardener to G. Hanbury, Esq. Blythewood, Burnham, Bucks, May 15th, 1906.

"I have been using your **'NIQUAS' Insecticide** for some years, and can with all confidence say it is the best I have ever used for Bug, Thrip, Red Spider, American Blight; and for all Insect Pests it has no equal. Also for the destruction of Maggots in Marguerites by dipping. I have recommended it to my friends generally."

To be had from all Seedsmen and Florists.

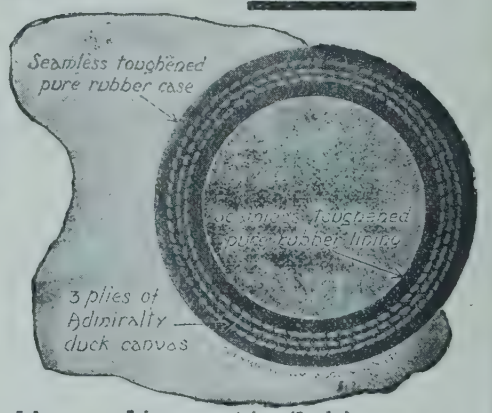
GARDEN HOSE. "RHINOHIDE" BRAND.

This Hose is built to our special specification from the purest materials, without the admixture of any makeweights whatever; colouring matter is even excluded, preserving the natural light grey colour. The inner lining is SEAMLESS, of the purest toughened rubber procurable, thoroughly frictioned to and covered with three plies of ADMIRALTY STANDARD Quality Duck Canvas, the whole encased in the outer cover of purest toughened rubber. The ends of each length are rubber sealed, uniting the inside lining and outside cover, preventing any moisture or grit working into the plies. With absolute confidence **we claim this to be**



The Best Hose in the World

and back it with 10 Years' Guarantee.

PRICES. Carriage Paid to Railway Station.

Internal diam.	½-in.	⅝-in.	¾-in.	1-in. (3-ply).
Rhinohide Hose	***1/-***	***1/2***	***1/4***	***1/9***

(Per foot run in 60-ft. lengths).

Huge Stocks Held.
So confident are we in this Hose that we have put into stock unprecedented quantities.

Orders Railed Same Day.
No waiting unless special fittings have to be made.

Better than Armoured Hose.
Lasts longer; no rusty wire; no cutting up of lawns and paths.

MARKETS.

COVENT GARDEN, July 16.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—Supplies of Australian Apples are now being drawn from cold storage, these being the only dessert Apples obtainable. Strawberries are now limited to a few late varieties. The early varieties of Cherries are finished, and the later varieties consist of Napoleons, Bigarreau, etc. Continental supplies of Apricots are limited. Red, black, and white varieties of Raspberries and Currants are plentiful and good. Peaches and Nectarines have been more plentiful during the past week. There still continues to be a good supply of green Figs and Melons. Grapes of all varieties are plentiful. Continental supplies of Greengages and Plums have increased. Loganberries are plentiful and good. Tomatos have been much more limited in supply during the past week. Runner and French Beans are plentiful. The supplies of Peas have not been equal to the demand. Vegetable Marrows are abundant, and ordinary vegetables have shown a falling off in the supplies during the past week.—*Edgar H. Rides, Covent Garden, July 16, 1913.*

PRIVATE.

HERTFORDSHIRE COUNTY COUNCIL.—HORTICULTURAL INSTRUCTOR.—The Hertfordshire County Council invite applications for the post of Peripatetic Lecturer and Staff Instructor in Horticulture and Botany. The Instructor appointed will be required to teach and supervise Gardening at Elementary Schools, and to give lectures upon the above-named subjects. He will also be required to act as Inspector under the Gooseberry Mildew Order issued under the Destructive Insects and Pests Act. The appointment will be probationary in the first instance, and will be subject to the approval of the Board of Agriculture and Fisheries. The salary will be £140 per annum. The Instructor will be required to devote his whole time to his duties, and to provide and maintain a bicycle in respect of which he will receive a mileage allowance. Applications must be made on forms which can be obtained from the Assistant Education Officer, Mr. A. DEAN, Eastfield, St. Albans, and must reach him not later than July 30, accompanied by copies of not more than three recent testimonials.—C. E. LONGMORE, Clerk to the Hertfordshire County Council. Education Department, Hertford, July 12, 1913.

EAST HAM CORPORATION.—BOWLING-GREEN KEEPER.—The CORPORATION invite applications for the post of BOWLING-GREEN KEEPER in the Central Park, East Ham. Candidates must be between the ages of 25 and 45 years, and must have had previous experience in the management, laying out, and keeping Greens in condition. The candidate appointed will be required to act under the Borough Engineer, and to devote his whole time to the duties of the office. The wages will be 35s. per week with uniform. Applications (in candidates' own handwriting) on forms to be obtained from the undersigned, accompanied by copies of three recent testimonials (which will not be returned) to be addressed and delivered to THE MAYOR, Town Hall, East Ham, E., endorsed "Bowling-Green Keeper," not later than 12 o'clock noon of Tuesday, July 22, 1913. Canvassing the members of the Council, directly or indirectly, will disqualify. (By Order) C. EUSTACE WILSON, Town Clerk, Town Hall, East Ham, E., July 10, 1913.

THE FINE ARTS, MUSIC, AND THE DRAMA

appears every week in

THE ATHENÆUM

EVERY FRIDAY. **PRICE THREEPENCE.**

THE ATHENÆUM was established in 1828, and has achieved an unprecedented continuity of policy. That policy has been the unprejudiced criticism of Literature, combined with notices as they take place of the more important Fine Art Exhibitions, Scientific Meetings, Plays, and Musical Performances.

To those who desire to obtain adequate knowledge and unbiased criticism of the subjects enumerated above THE ATHENÆUM is a necessity.

THE ATHENÆUM IS THE RECOGNIZED MEDIUM FOR EDUCATIONAL, LITERARY, AND MUNICIPAL ADVERTISEMENTS.

MARKETS.

COVENT GARDEN, July 23.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Vegetables: Average Wholesale Prices (cont.)

REMARKS.—New-season home-grown Apples of the varieties Early Julyan and Lord Suffield are on sale. There are a few fruits of Sturmer Pippin Apples from Tasmania which have been preserved in cold storage, and these are realising high prices. The rains have damaged most of the Cherries, and sound fruits are very scarce. Strawberries, with the exception of one or two late varieties, are finished for the season. Dessert Gooseberries are fairly plentiful, including good samples of White Lion variety. Supplies of Raspberries and Loganberries are decreasing, but Currants from all sources are plentiful and good. Grapes continue a good supply. Fewer Peaches and Nectarines have been received during the past week, but supplies of Figs and Melons exceed the demand. The earliest supplies of Pears from the Continent are to hand. Green Walnuts, such as are used for pickling, are obtainable. Plums and Greengages are arriving in a better condition than formerly; the fruits are packed in boxes and half-sieve baskets. There is still a shortage of Tomatos, and this also applies to Cucumbers and Vegetable Marrows. Vegetables have not been so plentiful during the past week, and their prices have advanced.—*Edgar H. Rides, Covent Garden, July 23, 1913.*

New Potatos.

	s.d.	s.d.		s.d.	s.d.
Bedford, per cwt.	4 6	5 3	Kent, per cwt.	5 0	6 0
Blacklands	4 3	4 9	Lincolns	4 6	5 6

REMARKS.—The Potato trade is very quiet; there is a good supply but a poor demand. Prices are much lower than last week and everything points to a further decline in value before the end of the present week.—*Edward J. Newborn, Covent Garden and St. Pancras, July 21, 1913.*

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS'.—On the 16th inst., about 40 of the members visited the Royal Gardens at Windsor. Here Mr. J. Brown, Foreman of the Fruit Department, conducted them through the gardens, first visiting the North Terrace, then across the golf links and the Home Park, where the scenery of "the Slopes" was admired, then by Adelaide Lodge, a pretty cottage in a very shady and sequestered part of the grounds. by the model farm, the Royal Dairy, the kennels and poultry-houses, and, skirting Frogmore House, when the party arrived at the main entrance to the gardens, which are about 30 acres in extent. A visit was made to the young gardeners' quarters and the boiler-houses, where the excellent system of heating was explained by the guide. For heating the 29 miles of pipes six large boilers are employed. Leaving the gardens the party was conducted to Frogmore House and Gardens, the Lily Pond, and the Mausoleum, noticing on the way the Maidenhair tree (Salisburia Adiantifolia), said to be one of the two largest in the country. Some members of the party afterwards visited the State apartments in the castle.

WATFORD HORTICULTURAL.—The monthly meeting of this Society was held on the 11th inst. at St. Andrew's Schools, under the chairmanship of Mr. H. G. Kellock. Owing to illness, neither of the lecturers announced to read papers were able to be present, but Mr. Stubbs' paper on "Pansy and Viola Culture" was read by Mr. Frank Newman. Mr. P. Henley gave a paper on "Seasonable Hints in the Kitchen Garden." By the kindness of the president, Mr. R. H. Comyns, the vice-presidents and members were invited to a garden party at Heath Farm House on the 12th inst., and nearly 200 took advantage of the president's hospitality.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.—The monthly committee meeting of the above Society was held at the R.H.S. Hall on the 14th inst., Mr. J. Harrison-Dick occupying the chair. The sick pay and maternity claims for the month amounted to £69 2s. 8d. Three members were allowed to withdraw the sums of £4 15s. 10d., £1 17s. 4d., and £1 14s. respectively, and one member was also allowed to withdraw £10 from his deposit account. The committee assisted one member from the distress fund. The sum of £26 13s. 7d. was passed for payment to the nominee of a deceased member, and the sum of £16 17s. 8d. standing to the credit of a lapsed member was also passed for payment. A long discussion took place on suggested alterations of the rules, and the debate was adjourned until the next meeting.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 19, is furnished from the Meteorological Office :—

GENERAL REMARKS.

Weather was generally in a very changeable condition, but the rainfall on some days was only slight and partial. Thunderstorms occurred locally in the South of England on Monday and Tuesday; on the former day storms were also experienced at Crathes and Dublin.

Temperature was slightly above the average in Scotland and in England N.E., but below it in all other districts. The highest readings occurred at various times, but mostly either on the 14th or 15th, or on the 17th. In Ireland and the North of Scotland the thermometer did not reach 70°, but in other parts of the Kingdom it exceeded that level, and in England E. it touched 75°. The lowest readings, which occurred also at times varying greatly in the different districts, ranged from 41° in England S.W., and 43° in the Midland Counties and England N.W. to 49° in Ireland, and to 53° in the English Channel. The mean temperature of the soil was in most places rather below the average at a depth of both 1 foot and 4 feet, but in the East of Scotland and the North of England the thermometer at a depth of 1 foot recorded an excess of warth.

Mean Temperature of the Sea was lower in most places than in the corresponding week of last year, but on the Scottish coasts it was slightly above the average. On the English and Irish coasts it was, in most places, decidedly below the normal. The mean values ranged from 61.8° at Seafield, and 60.2° at Shipwash, to between 52° and 54° on the north and north-east coasts of Great Britain.

Rainfall amounted to considerably less than the average in all districts, excepting England E. and S.E, where there was a rather large excess, due to heavy falls which occurred on the 14th, when more than an inch was recorded at many of the eastern stations, and as much as 2 inches at Lowestoft. On the same day nearly 1¼ inches were recorded during a thunderstorm which occurred at Crathes.

Bright Sunshine was very deficient, especially in the Midland Counties, England S.E. and Ireland N., where the mean daily duration amounted to less than two hours, and the proportion of the possible ranged between 10 and 12 per cent. In England N.W. the daily mean amounted to 4.3 hours, in the English Channel to 4.5 hours, and in Scotland W. to 4.6 hours, but in each of these districts the percentage of the possible was less than 30.

Barometer and Wind.—At the commencement of the week, when a shallow area of low pressure advanced over our northern districts from the Atlantic, light to moderate breezes from the south-west, veering to west or north-west, were experienced very generally. Later on the northern disturbance moved south-eastwards, while a smaller depression travelled north-eastwards across Portugal, the Bay of Biscay, and France, the two systems ultimately becoming united over the Netherlands and North Germany, and causing a temporary shift of the wind to the north over nearly the whole of the United Kingdom. During the latter half of the week a large depression of little intensity moved steadily eastwards from Iceland to Scandinavia, while small secondary disturbances passed in a similar direction across these islands. The prevailing winds were consequently between west and south-west, but the force did not exceed that of a moderate breeze.

THE WEATHER IN WEST HERTS.

Week ending July 23, 1913.

The third unseasonably cold week in succession.—Another cold week, and the third in succession. The days were all cold for the time of year, and with one exception also the nights. On the coldest day the temperature in the thermometer screen did not rise above 55°—making this the coldest day experienced here in July since 1888, or for twenty-five years. On the coldest night the exposed thermometer registered a temperature within 5° of the freezing-point. The ground is now 3° colder at 2 feet deep, and 5° colder at 1 foot deep, than is seasonable. Rain fell on three days, but to the total depth of only ¼ inch. There have been a few drops of rainwater each day through the bare soil percolation gauge, but none at all through the gauge on which short grass is growing. The sun shone on an average for only 2¾ hours a day, which is 3½ hours a day short of the average daily duration for the middle of July. On the one bright day the sun shone for nearly 12 hours, but on the other hand there were three other days when the sun was shining for less than an hour. Light airs and calms alone prevailed during the week, the direction of these light airs being principally some westerly point of the compass. The mean amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 10 per cent. *E. M., Berkhamsted, July 23, 1913.*

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

WANTED, HEAD GARDENER; experienced man, with thorough knowledge of Indoor and Outside work, including Herbaceous Borders, Flowering Shrubs, Rock Garden, and usual Fruit and Vegetables; capable of managing 14 to 15 men; state all particulars as to age, experiences and wages, if married, and family.—Applications, with copies of references, to J. HAMILTON, Esq., Estate Office, West Stratton, Micheldever Station, Hants.

WANTED, for Warwickshire, HEAD WORKING GARDENER where two and a boy are kept; quiet country situation; must be exceptionally recommended by late employer, and have thorough knowledge of Herbaceous Gardening and Roses, Kitchen Garden, Fruit Trees, etc.; practically no Glass.—Apply stating age, if married and family, and wages asked where cottage with two bedrooms is provided, to B. C., Box 15, 41, Wellington Street, Covent Garden, W.C.

WORKING GARDENER required, as Head of five; Scotsman preferred; must be reliable, firm with his men, and thoroughly trustworthy in every respect; comfortable permanency for industrious, energetic and capable man; cottage found; state age, wages expected, and usual particulars.—S. R., Box 8, 41, Wellington Street, Covent Garden, W.C.

WANTED, HEAD WORKING GARDENER, where 4 are kept; a thoroughly first-class man in all branches; age about 35, and married.—State fullest particulars of previous experience to E. J. SPENCER, Findon Place, Findon, Sussex.

WANTED, HEAD GARDENER (WORKING), where 7 are kept; must be a really first-rate man, experienced in all the duties of a large garden, and especially well up in Rock and Alpine Plants; wages 40s.—L. W., Box 9, 41, Wellington Street, Covent Garden, W.C.

WANTED, WORKING HEAD GARDENER (August); two men and boy under; wages 24s. and cottage; Foreman from large Gardens preferred.—A. F. BOTT, Bennington, Lordship, Stevenage.

WANTED, SINGLE-HANDED GARDENER, age 20 to 30; willing to make himself useful; abstainer preferred; single; cottage and board provided.—Send full particulars as to experience and wages asked to KEL, Lamorbey House, Sidcup, Kent.

WANTED, GARDENER (single man) to take the lead in Pleasure Grounds, Herbaceous Borders, etc.; also FIRST JOURNEYMAN (INSIDE).—Apply, J. PURVER, The Gardens, Hemsted Park, Cranbrook, Kent.

WANTED, Experienced GARDENER, with thorough knowledge of Flowers; one only kept; live out.—Apply by letter only, giving full particulars, age and wages required, to E. ATKINS, Oaklands, Bycullah Park, Enfield, Middlesex.

GARDENERS for Australia, on Fruit and Vegetable Farms, near Melbourne; 17s. 6d. to 35s. weekly, with board; regular work and good prospects; fare, £8. Send envelope.—Councillor RUMSEY, Shrewsbury.

WANTED, Man and Wife for Country Cottage in Sussex; man to act as SINGLE-HANDED GARDENER; wife to keep cottage clean and cook for owner at week-ends; wages £1 a week, light, firing and house-room; no children; must have good references.—Reply to F., 19, Cheyne Walk, Chelsea.

WANTED, CHAUFFEUR-GARDENER, able to drive small car occasionally; two Gardeners kept.—Apply, stating wages and experience, MARSHALL, Dudley House, Isleworth.

WANTED, SECOND GARDENER (3 kept, occasional assistance); experienced in Vegetables, good knowledge of Flowers, Inside and Out; single, age 25 to 30; letters first. — MRS. TYNDALE, Meadowcroft, Chislehurst.

MR. NICHOLLS, Burleigh House, Sutton, requires a good SECOND GARDENER, about 30, to take Head Gardener's place; two others kept; must be strong, active and willing, and be well recommended; married, without children preferred.

MARKETS.

COVENT GARDEN, July 30.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—A few samples of Tasmanian Apples are still obtainable, the majority consisting of Sturmer Pippins. The English Apples now arriving include the varieties Gladstone, Beauty of Bath, Quarrenden and Ecklinville Seedling. The first shipment of new season Californian fruits received this year include Pears and Plums. The supplies of Cherries are limited. Grapes of all varieties are still abundant. Sufficient Peaches and Nectarines are obtainable to satisfy demands, and there are larger consignments of these fruits from France and Holland. There are large quantities of Green Figs and Melons in the market, and they do not find a very quick sale. White and Red Currants are nearly over for the season. Black Currants have been fairly plentiful. Raspberries are exceedingly abundant from all sources, including the Blairgowrie district. Plums on sale included the variety Early Rivers. Large supplies of Greengages are arriving from Continental countries. During the preceding week the Tomato supply has increased. All kinds of vegetables are plentiful.—*Edgar H. Rides, Covent Garden, July 30, 1913.*

New Potatos.

Bedford, per cwt.	4 0	4 6	Kent, per cwt.	4 0	4 9
Blacklands	3 6	3 9	Lincolns	3 9	4 6

REMARKS.—The Potato trade is very quiet; there is a good supply but a poor demand. Prices are much lower than last week, and everything points to a further decline in value before the end of the present week.—*Edward J. Newborn, Covent Garden and St. Pancras, July 29, 1913.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 26, is furnished from the Meteorological Office :—

GENERAL REMARKS.

Weather.—In all the western parts of the kingdom, as well as in the extreme north, the conditions were generally fine and bright, but over the eastern and south-eastern districts there was much cloud, although little rain fell.

Temperature was below the average, the deficit ranging from more than 4° in England East and North-East, to less than 1° in England South-West and Ireland South. The highest of the maxima were recorded at most stations during the later half of the week, and ranged from 79° in Ireland South, and 78° in Scotland West, to 70° in England North-East and East. About the middle of the week the maxima in the South-East and East of England were unusually low for the time of year—below 60° at some stations. The lowest of the minima, which occurred, as a rule, during the earlier days of the period, varied from 31° in Scotland East (at Balmoral on the 24th), and 38° in Ireland North, to 45° in England East, and to 51° in the English Channel. The lowest grass readings reported were 29° at Balmoral, 31° at Markree Castle, and 32° at West Linton. The temperature of the earth at a depth of 1 foot, and also at 4 feet, was below the normal at nearly all stations, the defect at 1 foot amounting to as much as 5.6° at Shoeburyness and about 4.5° at Yarmouth and Fulbeck.

Mean temperature of the sea.—On our south-west coasts the sea water was warmer than in the corresponding week of last year, but in most other localities it was a trifle cooler. The mean values, which were above the average in Scotland and also in the south of Ireland, ranged from 62.9° at Seafield and a trifle above 60° off the south-west of England, to 54° and less on the north and north-east coasts of Great Britain and to a little below 53° at Burnmouth.

Rainfall was much less than the normal in all districts. At a considerable number of stations in Scotland and the south-west of England, and at some in Ireland and the south of England, the week was rainless.

Bright sunshine exceeded the average over the western section of the Kingdom and in Scotland North and East, but was deficient elsewhere. In England North-East, where the daily mean was less than three hours, the percentage of the possible duration was only 17, but in England South-West and the English Channel the daily mean varied between 9 and 10 hours, and the percentages were respectively as high as 60° and 65°.

Barometer and wind.—A shallow depression appeared off the north-west of these islands on Monday, and subsequently travelled in a south-easterly direction, but as a whole the pressure distribution over the western and northern districts was anticyclonic. The eastern and south-eastern districts, however, were under the influence of a depression to the eastward. Until Tuesday night the centre of the system was over the south

of Scandinavia, but it then moved south-south-westwards to Holland, and caused the wind to increase to a high wind or gale from the north-westward along the north-east coasts of Britain. The depression afterwards moved away in a south-easterly direction and the wind over England moderated in force and shifted to the north-eastward.

THE WEATHER IN WEST HERTS.

Week ending July 30.

The fourth unseasonably cold week in succession.—This was, on the whole, a cold week, and the fourth in succession. It, however, had in it the two warmest days of the present month. The nights were remarkably equable in temperature, and only slightly colder than is seasonable. On the two warm days the temperature in the thermometer screen rose respectively to 76° and 77°. Notwithstanding these two warm days, the ground is now one degree colder than is seasonable at 2 feet deep, and at about an average temperature at 1 foot deep. No rain fell during the week, and there has been no percolation at all through either of the soil gauges for three days. The sun shone on an average for 6¼ hours a day, which is about the mean duration of bright sunshine for the end of July. On the first day of the week no sunshine at all was recorded, whereas on the brightest day the sun was shining brightly for 11½ hours. Light airs and calms have again prevailed, and for the past six days the direction has been exclusively some point between north and east. There was about a seasonable amount of moisture in the air at three p.m. *E. M., Berkhamsted, July 30, 1913.*

DEBATING SOCIETIES.

BRITISH GARDENERS' (Edinburgh Branch)—On July 7 the members and friends of the Penrith branch of the B.G.A. visited Edinburgh. The first visit after breakfast was to the Royal Botanic Gardens, where the rock, wild and aquatic gardens, also the glass-houses were inspected. East and West Princes Street Gardens, Waverley Market roof garden, and Messrs. Dobbie and Co.'s Nursery were also visited, and, later in the day, historical places of interest and the Forth Bridge.

COVENT GARDEN, August 6.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Vegetables: Average Wholesale Prices (cont.)

Remarks.—The supply of English dessert Apples is limited, but culinary varieties, including Ecklinville Seedling, Lord Suffield and Keswick Codlin are plentiful. Early Pears, such as the Chalk and Lamms varieties, are obtainable, also Early Rivers and Czar Plums. The first consignment of Californian Plums for the season arrived this week; the consignment also included William's Bon Chrêtien Pears. English Grapes have not been so plentiful as in previous weeks; the bunches have not ripened owing to a lack of sunshine. Black and Red Currants are fairly abundant, but Raspberries are almost finished for the season. English and Continental Melons are very plentiful. Greengages are, and have been, scarce for a short time. Peaches and Nectarines are selling well for the time of the year. Tomatos are exceedingly plentiful from all sources. A fall in the supply of Cucumbers has been noticed during the past week. Sufficient vegetables of the commoner kinds are available to satisfy demands.—*Edgar H. Rides, Covent Garden, August 6, 1913.*

Remarks.—Trade has been very quiet. Consignments have not been quite so plentiful, but at the same time the demand is not very good.—*Edward J. Newborn, Covent Garden and St. Pancras, August 6, 1913.*

DEBATING SOCIETIES.

Chester Paxton.—Mr. E. Peter Jones, a vice-president of the Society invited the members of the Executive Committee of this Society to visit his Gardens at Greenbank on the 2nd inst. Mr. William Dodd, the Gardener, was complimented by his brother gardeners on the excellent appearance of all departments, including the new Rose garden, the rock garden and the herbaceous borders.

GARDENING APPOINTMENTS.

[*Correspondents are requested to* **write the names of persons and places as legibly as possible**. *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

Mr. Jas. Vayro, previously Gardener at Unthank Hall, Haltwhistle, Northumberland, as Gardener to J. White, Esq., The Cedars, Low Fell, Durham.

George D. Reid, for the past 10 years Gardener and Bailiff to R. J. Lambert, Esq., Danes Hill, Oxshott, Surrey, as Gardener to W. W. Bourne, Esq., Garston Manor, Watford, Hertfordshire.

Mr. A. Garner, for the past 10 years Gardener to the late General and Mrs. Gunter, at Boston Hall, Boston Spa, and West Lodge, Malton, as Gardener to Mrs. Gunter, at Aldwark Manor, Alne, Yorkshire.

Mr. Ernest Beckett, for the past 5 years in the Gardens at Aldenham House, Elstree, as Gardener to Mrs. Gwynne Holford, Buckland Bwlch, Breconshire. [Thanks for donation of 2s. 6d. for R.G.O.F.—Eds.]

Mr. J. Smith, for the past 15 years Gardener to Jas. Brown, Esq., Heaton Mersey, as Gardener to W. Duckworth, Esq., Ribby Hall, Kirkham, Lancashire.

MISCELLANEOUS.

Laxton Bros., Bedford.—Strawberries, Small Fruits, and Roses.

In consequence of the increase in the circulation, and also of the earlier despatch of the morning trains from London, the hour of going to press has been again advanced, and in future Advertisements received after 5 p.m. on WEDNESDAY will be held over till the following week. On no consideration whatever will any exception be made to this rule

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 2, is furnished from the Meteorological Office :—

GENERAL REMARKS.

Weather.—In all parts of the kingdom the conditions were very dry, but in the northern and eastern districts the sky was occasionally very cloudy. A severe thunderstorm, accompanied by unusually heavy rain, was experienced in the Channel Islands on the 29th, and distant thunder was heard at Douglas (I.O.M.) on the 29th and 30th.

Temperature was above the average, except in England E., S.E. and N.E., the greatest difference being 2°.6 in Scotland N. The highest of the maxima occurred on rather irregular dates, and ranged from 82° in England S.E., and 81° in England N.E. and S.W. to 77° in Ireland N., 75° in England E. and the English Channel, and 74° in Scotland N. The lowest of the minima, which were mostly recorded early in the week, varied from 39° in Scotland E. and 40° in England N.E. to 47° in Scotland N., and to 55° in the English Channel. The lowest grass readings were 34° at West Linton, 35° at Crathes, Birmingham and Wisley, and 36° at Shrewsbury. The temperature of the soil was below the average at a depth of 1 foot, and also of 4 feet in almost all parts of the kingdom.

Rainfall.—Over the kingdom generally the week was rainless, but at Guernsey more than 2 inches fell during the severe thunderstorm of the 29th. At Jersey, where the thunderstorm was also experienced, the rainfall was only 0.06 inches.

Bright Sunshine exceeded the normal except in Scotland N. and E., England E., and English Channel. In Scotland N. the main daily duration was only 2.2 hours, and the percentage of the possible duration only 14, while in England N.W. the corresponding figures were 8.6 hours and 55, and in England S.W. 8.9 hours and 58°.

Barometer and Wind.—As a whole the pressure distribution was anticyclonic, and the wind light or moderate from between north and north-east or east. In Scotland, however, owing to depressions moving eastward beyond Iceland, a light westerly breeze prevailed at times. The only cyclonic disturbance in the immediate neighbourhood of this country was a shallow one that came up from the Bay region on Tuesday night, and subsequently travelled away over France, and had little effect either on the weather or the direction and force of the wind, except in the Channel Islands and their vicinity.

THE WEATHER IN WEST HERTS.

Week ending August 6.

Fifteen consecutive days without rain.—The day temperatures were mostly rather high, and on the warmest day the highest reading in the thermometer screen reached 78°. The nights, on the other hand, with one exception, proved cold for the time of year, and on the two coldest nights the exposed thermometer fell to within 6° of the freezing-point. Both at 1 foot and 2 feet deep the ground is at the present time 1° colder than is seasonable. No rain has now fallen for fifteen days—making what is known to meteorologists as an "absolute drought," viz., a period of more than fourteen consecutive days absolutely without measurable rain. No percolation at all has passed through either of the soil gauges for ten days. The sun shone on an average for 5½ hours a day, which is three-quarters of an hour a day short of the usual duration at the beginning of August. The first day of the week proved altogether sunless, while on one other day less than an hour's sunshine was recorded. On the other hand, on the brightest day the sun was shining for 10¾ hours. Light airs and calms have again prevailed, and for nearly a fortnight the direction has been almost exclusively some point between north and east. The mean amount of moisture in the air at three o'clock in the afternoon fell short of a seasonable quantity for that hour by 7 per cent.

JULY.

Cold, dry, unusually gloomy, and exceptionally calm.—Taken as a whole, this proved, with three exceptions, the coldest July recorded here during the past twenty-seven years. During the course of it there occurred only five unseasonably warm days, and but five warm nights. On the warmest day the highest reading in the thermomenter screen was 77°, which is a low extreme maximum temperature for the month. On the coldest night the exposed thermometer fell to the freezing-point—making this the coldest night recorded here in July since 1886, or for twenty-seven years. Rain fell on only eleven days, and to the total depth of less than 1½ inches, or about an inch in defect of the mean for the month. The sun shone on an average for only 3½ hours a day, which is as much as three hours a day short of the average duration for the month, and less than in any July since 1888—or for twenty-five years. The winds proved exceptionally light; in fact, it was the calmest July I have yet recorded here. In no hour did the mean velocity exceed nine miles—direction west. The average amount of moisture in the air at three p.m. exceeded a seasonable quantity for that hour by 7 per cent. *E. M., Berkhamsted, August 6, 1913.*

TRADE NOTE.

We are informed that Messrs. John Peed and Son, Roupell Park Nurseries, West Norwood, have been honoured with the Royal Warrant, and are appointed seedsmen and nurserymen to his Majesty King George V.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

White Heather, per doz. bunches	3 0-	8 0

REMARKS.—As usual at this time of the year, business in the flower market is very slow, and prices are low, with the exception of those for Lily-of-the-Valley, of which there is a limited supply. Carnations are numerous and only the very finest blooms, with the exception of Carola, realise 1s. 3d. per dozen. White and coloured Asters, Gypsophila elegans, G. paniculata and the double-flowered variety; Liliums, including L. longiflorum, L. lancifolium album and L. l. rubrum, are all plentiful. There are a few good specimens of L. auratum. Sweet Peas are practically finished for the season. Roses, like Carnations, are plentiful and difficult to dispose of. A few good blooms of white and yellow Chrysanthemums may be had, but they do not meet with a ready sale. For the next eight months there will only be three markets each week, and at present there is no special line worth mentioning. Even the Fern trade is exceptionally quiet, and many of the growers' stands are empty. Chrysanthemums and Astors are obtainable, and there should soon be a greater demand for these flowers.

Walnuts (green), per bushel	6 0	—

REMARKS.—Supplies of English Apples are increasing, especially culinary varieties. Of dessert Apples the principal sorts are Beauty of Bath and Gladstone. English Pears include the Chalk and Lammas varieties. Good dessert Pears are arriving from California and France, these consisting of the varieties Williams Bon Chrêtien, Bartlett and Souvenir du Congrès. Supplies of Raspberries and Currants are smaller. Of English Plums the following varieties are obtainable—Czar and Rivers' Early. Large quantities of Plums, including Gage varieties, are arriving from France, Spain and California. Black and Muscat Grapes are arriving from home growers in large quantities. Peaches are much more plentiful, but Nectarines are scarce. Melons and Figs continue plentiful. Large quantities of Tomatos are arriving from all sources. Supplies of Vegetables are unusually short for the season of the year.—*Edgar H. Rides, Covent Garden, August 13, 1913.*

New Potatos.

Bedford, per cwt.	4 0-	4 6	Kent, per cwt.	4 3-	4 9
Blackland	3 9-	4 0	Lincoln	3 9-	4 6

REMARKS.—The trade is very quiet, and the consignments are not very heavy, yet quite sufficient for the demand. The prices are about the same as last week.—*Edward J. Newborn, Covent Garden and St. Pancras, August 13, 1913.*

DEBATING SOCIETIES.

SOUTHAMPTON AND DISTRICT GARDENERS'. The usual monthly meeting of this society was held on the 31st ult.; the President, Mr. H. E. Molyneux, occupied the chair. A paper on "Fruits Under Glass" was read by Mr. G. T. Turner, of Hamble Cliff Gardens, Netley Abbey. Mr. Turner dealt fully with the culture of the vine. The lecture was much appreciated and the various points in the paper were discussed, diversity of opinion chiefly centring around the causes and cure of the splitting of thin-skinned Grapes. During July the members visited the Mount Gardens, Bishopstoke, and Elmsleigh, Basset.

BRISTOL AND DISTRICT GARDENERS'.—The monthly meeting of this society was held on the 31st ult., Mr. Baston presiding. A lecture on "Herbaceous Calceolarias" was delivered by Mr. Pratten. The lecturer recommended sowing the seed about June in boxes filled with two parts loam, one part leaf mould, and one part sand. Mr. A. C. James offered prizes for 12 named Roses. The 1st prize was won by Mr. Scott, and the 2nd by Mr. Danuels.

READING GARDENERS'.—The members, together with members from the Henley-on-Thames Society, visited the nursery of Messrs. Sutton and Sons, on the 28th ult. The visitors were conducted by members of the staff through the trials of flowers and vegetables. Leaving the trial grounds, the party, by invitation of Mr. Leonard Sutton (vice-president), proceeded to his residence, where tea was taken on the lawn. An inspection of the grounds at Hillside was afterwards made.

WATFORD HORTICULTURAL.—The usual monthly meeting of the above society was held on the 8th inst., Mr. Arthur Kingham occupying the chair. The subjects for discussion were "Horticultural Pests" and "Culture of Peas and Beans." Both subjects were ably dealt with, the former by Mr. A. Clements, of Ruislip Garden City, and the latter by Mr. W. G. Taylor, of Garston House Gardens.

GARDENING APPOINTMENTS.

[*Correspondents are requested to* **write the names of persons and places as legibly as possible.** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

MR. T. SEYMOUR, for the past 3½ years Gardener to COL. S. V. THORNTON, The Gables, Epping, as Gardener to MRS. HARTREE, Havering, Tunbridge Wells, Kent.

ENGLISH AND FOREIGN LITERATURE, SCIENCE,
THE FINE ARTS, MUSIC, AND THE DRAMA

appears every week in

THE ATHENÆUM

EVERY FRIDAY. **PRICE THREEPENCE.**

THE ATHENÆUM was established in 1828, and has achieved an unprecedented continuity of policy. That policy has been the unprejudiced criticism of Literature, combined with notices as they take place of the more important Fine Art Exhibitions, Scientific Meetings, Plays, and Musical Performances.

To those who desire to obtain adequate knowledge and unbiased criticism of the subjects enumerated above THE ATHENÆUM is a necessity.

THE ATHENÆUM IS THE RECOGNIZED MEDIUM FOR EDUCATIONAL, LITERARY, AND MUNICIPAL ADVERTISEMENTS.

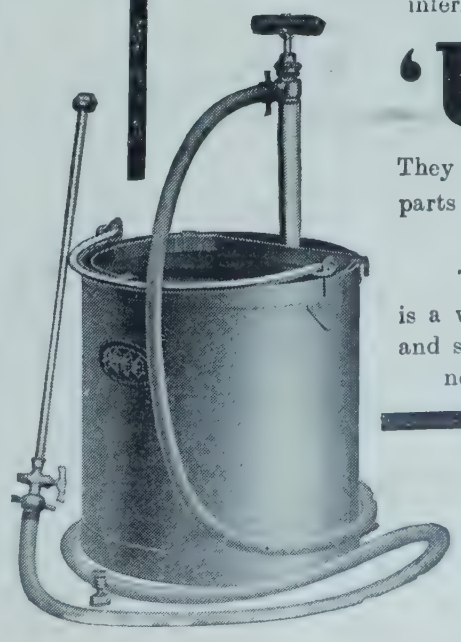
Limewash and Spray the easiest way

With a 'Ubel' machine, you will be surprised how quickly, cleanly, evenly, economically, and thoroughly it does the work, whether for the Trees in your Orchards, your Outhouses, Ceilings, Walls or Roofs. Don't tolerate the old pail and brush method. Don't experiment with interior machines. You can get absolute satisfaction from



'UBEL' Limewashing and Spraying Machines.

They are equipped with all the latest accessories; the working parts are easily accessible; they do not clog, and give ample power.

The 'UBEL' ORCHARD Sprayer and Limewasher

is a wonderfully powerful machine, simple in construction, easy and speedy to work. Retailed complete with Pump, Hose (two nozzle), 6 gallon galvanised container and strainer, **54/-.**

Just send us postcard now and we will mail you our Illustrated Catalogue Free.

Tuberoses, per gross	3 0- 4 0	
White Heather, per doz. bunches	3 0- 8 0	

REMARKS.—The cut-flower trade remains very quiet, for there is very little improvement on last week. There is a larger supply of white and coloured Asters. Chrysanthemums are becoming more plentiful, and the quality of the blooms is much better, especially those disbudded of such varieties as Countess, Mercedes, Delores, Mrs. Beech and White Queen. The firm of P. Ladds, Swanley, is sending some very fine specimens which are equal to the best blooms seen in November. Bunches of "spray" flowers include such varieties as Crawford White, Horace Martin, Carrie, Bronze Massie, Rio de Blana and Betty Spark. The white blooms find the more ready sale. English-grown Gladioli of the variety America and Brenchleyensis type are very fine. In addition to these there is an abundant supply of mixed sorts from Holland. Supplies of The Bride exceed the demand. Carnations, Roses, Gypsophila, Lillums, Statice, Stocks, double white Sweet Sultan and white Heather are all plentiful. Prices for Lily-of-the-Valley, Stephanotis, Lapagerias, Pancratium, and a few Orchids such as Cattleya, Odontoglossum and Cypripedium, remain firm owing to a limited supply. There is very little alteration to record in the plant market. Chrysanthemums and Asters are more plentiful, but trade for these plants is very slow. The Fern trade is expected to be a little better than last week. Asplemums are very scarce. The plant market is open on Tuesdays, Thursdays and Saturdays.

DEBATING SOCIETIES.

BROUGHTY FERRY HORTICULTURAL. — The Sweet Pea exhibition of this association was held on the 13th inst., when there was a fine display of flowers in the various classes. The Baxter Gold Medal, offered for a decorated table display, was won by Mr. J. McOmish, nurseryman, Crieff; 2nd, Mr. James Bethel, The Grange Gardens. Mr. George Masson won the Silver Medal. Mr. John Campbell was awarded the 1st prize for 8 vases of Sweet Peas; 2nd, Mr. I. Staward. Other exhibitors who received prizes were Dr. Sinclair, Forfar; Messrs. J. Duthie, Claverhouse; Mr. W. Brown, Cambuslang; Mr. D. K. Miston, and Mr. J. Fraser, Cairniehill Gardens, Arboath. A non-competitive exhibit of Sweet Peas and Roses was shown by Messrs. W. and W. Croll.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 16, is furnished from the Meteorological Office :—

GENERAL REMARKS.

August 19, 1913.

Weather was dull and of a rather unsettled type over the whole of the Kingdom, but rain was infrequent over all the eastern and some of the western districts, and light over the country generally. Thunder or thunderstorms occurred at Nottingham, Folkestone, and Cambridge on the 11th, and at Douglas, Buxton, and Morpeth on the 16th.

Temperature was just equal to the normal in Scotland N., but rather above it in the western section of the Kingdom, as well as in Scotland E. and the Midland Counties. In England N.E. and S.E. it was a shade below, and in England E. a degree below the average. The highest of the maxima were recorded very generally on the 16th, and ranged from 79° in England S.W., and 77° in England S.E. and Ireland S. to 73° in Scotland W., and to 72° in Scotland N. The lowest of the minima occurred in most localities early in the week, and varied from 37° in Scotland E., and 39° in Scotland W. to 43° in England S.W., and to 54° in the English Channel. The lowest grass readings were 32° at West Linton, 34° at Crathes and Hereford, and 35° at Balmoral, Glasgow, Hoylake, and Armagh. At almost all stations the temperature of the earth was below the mean at the depths of 1 foot and 4 feet.

Mean temperature of the sea was higher than during the corresponding week of last year, except at a few north-eastern stations, the excess being more than 3° on many parts of the coast. As a whole, however, it differed little from the normal for the time of year. The means for the week ranged from about 62.5° at Eastbourne and Seafield and between 60° and 61° on the south-west coast of England to 53° at Wick.

Rainfall was less than the average in all districts, the deficit being considerable or large, except in the English Channel, where Scilly registered 1.5in. on the 11th. In several parts of Great Britain the total fall was less than 0.1in.

Bright sunshine was deficient over the whole Kingdom. In Scotland and Ireland the daily mean was 3 hours or less, and in the Midland Counties only 2.1 hours. The percentage of the possible duration ranged from 37 in the English Channel and 32 in England E. to 17 in Scotland W. and Ireland N., and to 14 in the Midland Counties.

Barometer and Wind.—During the greater part of the week pressure was high to the south-westward of these Islands, and low over Scandinavia; while over the United Kingdom the barometer, although as a whole uniform, showed small irregularities. Until Thursday evening the main wind was light or moderate from between north and north-west or west, but subsequently the south-western high pressure extended across this country, and the wind became very variable in direction.

THE WEATHER IN WEST HERTS.

Week ending August 20, 1913.

Very dry and gloomy.—The day temperatures proved variable, the highest reading in the thermometer screen on three days rising to or above 70°, whereas on the coldest day the same thermometer only reached 59°. All the nights proved warm, the exposed thermometer never falling below 45°. At 2 feet deep the ground is at the present time 1°, and at 1 foot 2°, colder than is seasonable. Some rain fell on three days of the week, but the total measurement only amounted to about one-tenth of an inch. No rainwater at all has now passed through either of the percolation gauges for more than three weeks. The sun shone, on an average, for only 2¾ hours a day, which is as much as 3¼ hours a day short of the mean daily duration for the middle of August. One day proved altogether sunless, while on two other days less than an hour's sunshine was altogether recorded. For the tenth week in succession the winds have been very light, and during the last four days the direction has been almost exclusively some northerly point. There was a seasonable amount of moisture in the air at three o'clock in the afternoon. *E. M., Berkhamsted, August 20, 1913.*

STEVENS' AUCTION ROOMS

38, KING STREET, COVENT GARDEN, LONDON, W.C. **Established 150 years.**

BULBS.

ARMITAGE'S, HUDDERSFIELD

Can supply you with the very finest Bulbs it is possible to produce. During the past few years we have made Bulbs one of our specialities, sending out only the very best quality, and seeing our output has increased about ten times without advertising, proves the quality of our bulbs.

To give some idea of the size, we may say that such varieties of Daffodils as Emperor (very fine), Golden Spur, Sir Watkin, etc., average nearly 3 blooms per bulb. Dutch Hyacinths and Tulips are quite equal in quality, although, of course, they only produce one spike.

As regards prices, we do not, and never shall, attempt to compete merely in this respect, as our first aim is to supply absolutely the best article, and if intending purchasers could only see the Bulbs we offer, we are sure they would decide our prices very reasonable.

Our new 1913 BULB CATALOGUE will be posted free on application to—

ARMITAGE'S, SEEDSMEN,
HUDDERSFIELD.

MARKETS.

COVENT GARDEN, August 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Tuberoses, per gross	3 0-	4 0
Violets, English, per dozen bunches	1 6-	2 0
White Heather, per doz. bunches	3 0-	5 0

REMARKS.—Trade in the flower market remains very quiet. There is an abundant supply of hardy flowers, including Coreopsis, Gaillardia, Asters, Montbretia, Gypsophila, Statice, Marguerites, Scabiosa, and Gladioli. Asters are at their best condition; the pale mauve and pink varieties are exceptionally fine. Of Orchids, large Cattleya blooms, C. Harrisonii and Odontoglossum all realise good prices. Prices for Lily-of-the-Valley, Stephanotis, Lapageria and Pancratium remain firm. Chrysanthemum are seen in increased numbers, and the blooms are arriving in a good condition. But these flowers are marketed much too early in the season, and in consequence are sold at very low prices. English Violet and Physalis can be procured. There is an overwhelming supply of Carnations and Roses.

Cut Foliage, &c.: Average Wholesale Prices.

Walnuts (green), per bushel	6 0	—

REMARKS.—Larger supplies of English Apples are arriving, Warner's King and Sterling Castle forming the chief varieties. English Pears of the varieties Hessle and Williams Bon Chrétien have commenced to arrive this week, and some fine samples of the latter are also arriving from France and California. All the seasonable varieties of Plums are very plentiful, and there are good consignments of these fruits from the Continent. Grapes of all varieties may be had in large quantities. Supplies of Peaches have been shorter during the past week. Nectarines continue to be very scarce. The supplies of Melons and Figs are about equal to the demand. Tomatos from English and Continental growers continue to arrive in large quantities daily. Cucumbers have been more plentiful than is usual at this time of the year. Mushrooms are a very limited supply. Kent Filberts are obtainable. Larger supplies of Vegetables are coming to hand, especially Beans, of which there are large consignments from Holland.—*E. H. R., Covent Garden, August 27, 1913.*

REMARKS.—Trade is still very quiet, and prices remain low. Consignments are not quite so heavy this week. *Edward J. Newborn, Covent Garden and St. Pancras, August 26, 1913.*

DEBATING SOCIETIES.

CARDIFF GARDENERS'.—The annual outing of this association took place on Tuesday, the 12th inst., when the members visited the Royal Gardens at Windsor. London was reached at 6 a.m., and time was spared to visit the flower beds in Hyde Park. After breakfast the journey was resumed to Windsor, which was reached at 10 a.m. Mr. Brown, foreman of the fruit department at Windsor, conducted the visitors through the Royal Gardens.

GARDENING APPOINTMENTS.

[*Correspondents are requested to* **write the names of persons and places as legibly as possible.** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

THE WEATHER.

GENERAL REMARKS.

Weather.—Until the week drew towards its close the weather was dry and generally fair to bright, but later rain fell in all parts of the Kingdom, the quantity being large at many places in the west and north-west of Great Britain, but generally slight in the south and east. Thunderstorms or thunder only occurred at a few stations on the 23rd.

Temperature was above the average, except in Scotland East and West and England North-west, the greatest divergence being 1.8° in Ireland South. The highest of the maxima occurred over the Kingdom generally on the 21st or 22nd, and ranged from 80° in the Midland Counties to 72° in Scotland North and England North-west. The lowest of the minima, which at many stations were also recorded on the 20th or 21st, varied from 35° in Scotland North and East to 44° in Ireland South, and to 49° in the English Channel. The lowest grass readings were 30° at Crathes and Southport, and 31° at West Linton, Birmingham, Newton Rigg, and Armagh. As a general rule, the temperature of the earth was below the normal both at a depth of 1ft. and 4ft., but in a few localities it was above it at 1ft., and at Dublin and Manchester a little above it at 4ft.

Mean Temperature of the Sea.—The water was warmer than during the corresponding week of last year on practically all parts of the coast, and in most localities its temperature was above the average also. The mean for the week ranged from about 62° at Seafield, on the south coast of Devon, and at Eastbourne to 55° at Burnmouth and Aberdeen, and to 54° at Wick and Lerwick.

Rainfall was less than the average, except in Scotland West and England North-west, the deficit being large in several localities. At some places in the West of Scotland, the North-west of England and in Wales, the fall was very heavy on the 21st and 22nd. On the former date 1.4in. fell at Poltallock, and 2in. at Aspatria, and on the latter 1.1 at Cheadle, and 1.6in. at Aberdovey. On the 22nd about ¾in. fell at Nottingham and Spurn Head.

Bright Sunshine was less than the normal in all the central and eastern parts of England, above it in the western and northern parts of the Kingdom. In England East and North-east and the Midland Counties the daily mean was 4.5 hours, or less, while the percentage of the possible amount in England North-east was only 29. In the North and West the daily mean was between six and seven hours. In the English Channel it was as much as 8.5 hours, the percentage of the possible duration being 61°.

Barometer and Wind.—Until Wednesday evening the pressure distribution was anti-cyclonic, and the wind light and chiefly between north and north-east. From that time, however, the conditions became cyclonic, a large depression extending over the west and north of these islands from the Atlantic, and its small secondaries travelling in an easterly direction on a course further south. The wind shifted to the south-west or west very generally, and increased considerably in force. A high wind was experienced in the English Channel, and a gale on the extreme north coast of Ireland.

THE WEATHER IN WEST HERTS.

Week ending August 27, 1913.

Warm, Very Dry, and Sunny.—All the days of the past week proved warm, and on the two warmest days the highest reading in the thermometer screen reached 77°. The nights were very variable, the exposed thermometer on two of them never falling below 51°, while on three other nights the same thermometer indicated readings within 4° of the freezing-point. On three days the difference between the lowest and highest readings in the thermometer screen exceeded 30°, and on one of those days amounted to as much as 35°. The ground is now of about seasonable warmth at 2 feet deep, and 1° warmer than the average at 1 foot deep. Some rain fell on four days of the week, but to the aggregate depth of less than ¼ inch. No rainwater at all has now passed through either of the percolation gauges for a month. The sun shone on an average for 7¼ hours a day, which is 1½ hours a day longer than the mean duration for this part of August. This was the first bright week recorded here since the end of June, or for eight weeks. Light airs and calms again prevailed during the week, the direction of the light airs being principally some point between south and west. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by as much as 11 per cent.

STEVENS' AUCTION ROOMS

(ESTABLISHED 150 YEARS),

38, King St., Covent Garden, London, W.C.

SALE OF ONE OF THE BEST COLLECTIONS OF ORCHIDS IN ENGLAND.

By Order of Dr. Eager, of Northwoods, who is leaving the neighbourhood.

EDWARD T. PARKER & CO., F.R.H.S., will SELL by AUCTION at their Rooms in St. Stephen Street, Bristol, on Thursday, September 25, 1913, at 11 o'clock precisely,

1,500 ORCHIDS,

of the choicest and rarest varieties, many having won prizes in the leading Shows in the country against the keenest competition, embracing Lælio-Cattleya Hybrids, Lælias, Odontoglossums, choice Cypripediums, Cymbidiums, Masdevallias, Miltonias, and other sorts, offering an opportunity to collectors rarely met with. The collection is healthy, in grand conditions, and will be sold without the slightest reserve. No other lots will be included. Catalogues of the Auctioneers as above.

LOW LANE, WOODSIDE, HORSFORTH,

AND

ST. ANN'S NURSERIES, 459, KIRKSTALL RD., LEEDS.

A rare opportunity to energetic and enterprising Nurserymen to secure old-established businesses, with exceptionally good local markets for all kinds of Ferns, Tomatos, Cucumbers, Carnations, Chrysanthemums, Liliums, and Flowering Pot Plants.

SALE OF A FREEHOLD NURSERY GROUND, 13 UP-TO-DATE GREENHOUSES, WITH OFFICE, PACKING AND POTTING SHEDS, ALSO BRICK-BUILT SPAN PITS, &c.

And in Two Lots, as a Going Concern,

19 EXTENSIVE GREENHOUSES, with CORRIDOR and LEAN-TO, having perfected Heating Apparatus, recently overhauled and refitted by Newton, Chambers and Co., Sheffield.

By instructions of the Proprietor, who is relinquishing the Nursery Business.

MESSRS. WHITHAM & SONS are instructed to offer for SALE by AUCTION, at the Law Institute, Albion Place, Leeds, on Tuesday, the 16th September, 1913, at four o'clock in the afternoon, subject to the General Conditions of Sale of the Yorkshire Union of Law Societies, and to such special conditions as shall be then produced and read:—

Lot 1.—ALL THOSE TWO CLOSES OF LAND, formerly known as "INGS CLOSE" and "TOM ROYD HILL," but now as "COOKRIDGE NURSERIES," covering a total area of 4a. 0r. 18p., and situate in Low Lane, Woodside, Horsforth, with the

TWO BLOCKS OF MODERN PROPAGATING AND GROWING HOUSES, 13 in number, erected in 1909 by W. Duncan Tucker and Sons, Ltd., of London. Eight are 100 ft. long and 12 ft. wide, four 100 ft. x 18 ft. 6 in., and one 100 ft. x 27 ft. 6 in.

Together with OFFICE AND PACKING SHED 30 ft. 6 in. x 17 ft. 6 in., and POTTING SHED 70 ft. x 17 ft. 6 in.; the whole heated by four "Rochford" ring joint tubular boilers, and about 8,000 ft. of 4 in. hot-water piping; together with 7 sunk cold-water supply tanks, with piping and taps complete.

Also 4 rows of brick-built SPAN PITS, respectively 80 ft., 102 ft., 102 ft., and 80 ft. long, containing in all 220 6 ft. x 4 ft. lights, by Harris, London, and heated throughout with Longbottom's Medium Pressure Tubular Boiler and Piping, and also having cold water supply, together with materials forming 7 GROWING HOUSES, standing on land Cookridge side of Beck, 5 being 50 ft. long and 12 ft. span, one 28 ft. x 18 ft., and the other 40 ft. x 15 ft., partly built on brick and stone foundations.

Also a stone-built block of buildings, comprising COTTAGE, COACH-HOUSE, STABLING for 7 horses, with hay loft over.

The Estate has a frontage of over 1,000 ft. to Low Lane, in the township of Horsforth, on the southerly side.

It is well situated, being within ten minutes' walk of the Horsforth Station on the North-Eastern Railway, and about 20 minutes from Newlay Station, Midland Railway, and the Tramways connecting Leeds and Horsforth. Powers have also been obtained for laying an extension of the Leeds Tramways to within 5 minutes of the property.

Lot 2.—FIVE PROPAGATING & GROWING-HOUSES, erected with one exception on brick foundations, and of the following dimensions:—

No. 1., 80 ft. 6 in. long, with 24 ft. span, including office:
No. 2, 70 ft. long, with 26 ft. span;
No. 3, 70 ft. long, with 24 ft. 6 in. span;
No. 4, 70 ft. long, with 24 ft. 6in. span;
No. 5, 70 ft. long, with 24 ft. 6 in. span;
each having brick-edged planting beds, and Nos. 1, 4, and 5, brick and stone stages all round.

CORRIDOR, 92 ft. 6 in. long, with 12 ft. span, communicating with the foregoing.

LEAN-TO 70 ft. long, with 7 ft. 9 in. span, and brick-staging full length.

Another OFFICE & POTTING SHED, 27 ft. long and 22 ft. 6in. wide, former fitted with store cupboards and desk, and latter with iron tank for pot-washing purposes, and fixed benches.

The apparatus for heating all the foregoing comprises 2 of Kinnell's "Rochford" 1906 B pattern boilers, with water circulating and supply tanks as fitted on the Gould system, and over 3,500 ft. of 4-in. hot-water piping, 144 ft. of 3-in. and 815 ft. of 2-in. ditto, recently overhauled and refitted by Newton, Chambers and Co., Sheffield.

Also brick-built CHIMNEY, 20 ft. high, 8 sunk WATER TANKS, fitted with piping and taps, giving town's water supply, complete.

The erections previously described stand on a portion of land known as "St. Ann's Nursery," and situate at No. 459, Kirkstall Road, in the City of Leeds, held by the Vendor under a Lease for a term of 10 years from the 1st January, 1906, and a lease for a further period of years will be granted by the lessors to an approved purchaser.

There is a capital stone-built RESIDENCE, with 6 rooms and cellar, upon the Nursery site, which is included in the tenancy therewith at a net annual rental of £31 for the whole.

Lot. 3.—FOURTEEN PROPAGATING & GROWING-HOUSES, respectively numbered 6 to 19, six of which are each 78 ft. 6 in. long and 13 ft. wide, one 78 ft. 6 in. x 12 ft., five 70 ft. x 13 ft., one 70 ft. x 12 ft., and the remaining one 66 ft. x 13 ft., heated by an "deal" Sectional Boiler, Pattern No. 4 B, in 9 sections, and fixed new in January last, with water circulating and supply tanks, fitted on the Gould system, with 3,205 ft.

of 4-in., 475 ft. of 3-in., and 2,460 ft. of 2-in. hot-water piping, recently re-arranged, and fitted by Newton, Chambers, and Co.; also 14 town's water supply tanks, with piping and hot and cold water taps complete, and brick and stone staging in nine of the houses

In addition are 3 wood-built STORE SHEDS, respectively 26 ft. 6 in. x 14 ft., 14 ft. 3 in. x 10 ft. 3 in., and 13 ft. x 6 ft. 9 in.

These several erections are on a plot of land adjoining Lot 2, and held under a yearly tenancy, at the annual rental of £12

To each lot is a considerable tract of standing-out ground, with town's water laid on.

The properties comprising Lots 2 and 3 have good frontages to an important main road, are within easy reach of Leeds and Bradford Markets, and the Railway Stations of all systems, and have been established as Nurseries, and very successfully run as such by the late Mr. Featherstone for many years.

The purchaser will be given the option of acquiring at a fair valuation any Nursery Stock in land, houses, or frames, of either lot.

Any of the premises may be inspected at any time by arrangement through Telephone No. 139 Headingley, or by letter addressed to 459, Kirkstall Road.

Plans of Lot 1, and the Conditions of Sale, may be seen within 7 days of the date of Sale at the offices of Messrs. ARMITAGE & SPEIGHT, Solicitors, 5, Greek Street, Leeds.

R. WALLACE & CO., COLCHESTER.

BULBS.

ARMITAGE'S, HUDDERSFIELD

Can supply you with the very finest Bulbs it is possible to produce. During the past few years we have made Bulbs one of our specialities, sending out only the very best quality, and seeing our output has increased about ten times without advertising, proves the quality of our bulbs.

To give some idea of the size, we may say that such varieties of Daffodils as Emperor (very fine), Golden Spur, Sir Watkin, etc., average nearly 3 blooms per bulb. Dutch Hyacinths and Tulips are quite equal in quality, although, of course, they only produce one spike.

As regards prices, we do not, and never shall, attempt to compete merely in this respect, as our first aim is to supply absolutely the best article, and if intending purchasers could only see the Bulbs we offer, we are sure they would decide our prices very reasonable.

Our new 1913 BULB CATALOGUE will be posted free on application to—

ARMITAGE'S, SEEDSMEN,
HUDDERSFIELD.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

MARKETS.

COVENT GARDEN, September 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

White Heather, per doz. bunches..	3 0-	5 0

REMARKS.—Almost a week of sunless weather is having its effect, and prices are advancing, especially for some of the choicer indoor flowers. Asters, in common with most outdoor flowers, have been damaged by the recent rains, and growers should exercise more care in packing these flowers when they are wet. If too many bunches are placed in the same box they arrive at Covent Garden in an almost unsaleable condition, more especially if they are a few hours on the rail. Chrysanthemums in sprays are finding a better sale; blooms are more plentiful, and several fresh varieties have been sent to market since last week. The following sorts are all arriving in a good condition:—Débutante (White), Yellow Mercedes and Yellow Cranford, which is one of the best market sorts: Bronze Almirante, Mrs. Buck, Delores, Pink Cranford, Pink Betty Spark, and Hollycot Bronze. Carnations, Roses, Liliums, Gladioli, Gardenias, Stephanotis and Lapagerias, are gradually decreasing in numbers, and their prices are rising. Lily-of-the-Valley is still dear. Pink and White Heather, Statice and Sweet Sultan are all plentiful. There is also a good supply of foliage, such as Asparagus plumosus, Asparagus Sprengeri, Adiantum Fern, Smilax, Myrtle and Carnation "grass." Croton foliage may be obtained from the salesmen if ordered on the day previous.

— German, Switchen, per ½ sieve	1 6-	2 0
— Pond's Seedling per ½ bushel ..	5 0-	7 0
— Victoria, per ½ bushel	3 0-	4 6

REMARKS.—Supplies of Dessert and Cooking varieties of English Apples are steadily increasing. English and Continental Pears continue to be plentiful, the bulk consisting of William's Bon Chretien: some very fine samples of Dessert Pears are arriving from California. English and Californian Plums are plentiful and good, especially Pond's Seedling from home growers. Large supplies of English and Continental Grapes are arriving daily; in fact, Grapes are now at their lowest value. Melons have not been plentiful during the past week. There has been an increased number of Peaches in the market during the past few days, but Nectarines are still very scarce. New season Kent Cob and Filbert Nuts are obtainable. Field Mushrooms are arriving in the market. Indian Corn Cobs are fairly plentiful. Heavy consignments of English and Continental Tomatos are arriving daily. Vegetables from home and Continental growers have not been so plentiful during the past week; Cabbages especially have been scarce.—*Edgar H. Rides, Covent Garden, September 4, 1913.*

New Potatos.

	s.d.	s.d.		s.d.	s.d.
Bedford, per cwt.	3 6-	4 0	Kent, per cwt. ..	4 0-	4 6
Blackland	3 3-	3 6	Lincoln	3 6-	4 3

REMARKS.—Trade is still slow. Fewer consignments have arrived as the recent rains have prevented digging, and in consequence stocks in London are light. Prices remain about the same as those of last week.—*Edward J. Newborn, Covent Garden and St. Pancras, September 3, 1913.*

GARDENING APPOINTMENTS.

THE COOKRIDGE NURSERIES CO.

LOW LANE, WOODSIDE, HORSFORTH,

AND

ST. ANN'S NURSERIES, 459, KIRKSTALL RD., LEEDS.

A rare opportunity to energetic and enterprising Nurserymen to secure old-established businesses, with exceptionally good local markets for all kinds of Ferns, Tomatos, Cucumbers, Carnations, Chrysanthemums, Liliums, and Flowering Pot Plants.

SALE OF A FREEHOLD NURSERY GROUND, 13 UP-TO-DATE GREENHOUSES, WITH OFFICE, PACKING AND POTTING SHEDS, ALSO BRICK-BUILT SPAN PITS, &c.

And in Two Lots, as a Going Concern,

19 EXTENSIVE GREENHOUSES, with CORRIDOR and LEAN-TO, having perfected Heating Apparatus, recently overhauled and refitted by Newton, Chambers and Co., Sheffield.

By instructions of the Proprietor, who is relinquishing the Nursery Business.

MESSRS. WHITHAM & SONS are instructed to offer for SALE by AUCTION, at the Law Institute, Albion Place, Leeds, on Tuesday, the 16th September, 1913, at four o'clock in the afternoon, subject to the General Conditions of Sale of the Yorkshire Union of Law Societies, and to such special conditions as shall be then produced and read:—

Lot 1.—ALL THOSE TWO CLOSES OF LAND, formerly known as "INGS CLOSE" and "TOM ROYD HILL," but now as "COOKRIDGE NURSERIES," covering a total area of 4a. 0r. 18p., and situate in Low Lane, Woodside, Horsforth, with the

TWO BLOCKS OF MODERN PROPAGATING AND GROWING HOUSES, 13 in number, erected in 1909 by W. Duncan Tucker and Sons, Ltd., of London. Eight are 100 ft. long and 12 ft. wide, four 100 ft. x 18 ft. 6 in., and one 100 ft. x 27 ft. 6 in.

Together with OFFICE AND PACKING SHED 30 ft. 6 in. x 17 ft. 6 in., and POTTING SHED 70 ft. x 17 ft. 6 in.; the whole heated by four "Rochford" ring joint tubular boilers, and about 8,000 ft. of 4 in. hot-water piping; together with 7 sunk cold-water supply tanks, with piping and taps complete.

Also 4 rows of brick-built SPAN PITS, respectively 80 ft., 102 ft., 102 ft., and 80 ft. long, containing in all 220 6 ft. x 4 ft. lights, by Harris, London, and heated throughout with Longbottom's Medium Pressure Tubular Boiler and Piping, and also having cold water supply, together with materials forming 7 GROWING HOUSES, standing on land Cookridge side of Beck, 5 being 50 ft. long and 12 ft. span, one 28 ft. x 18 ft., and the other 40 ft. x 15 ft., partly built on brick and stone foundations.

Also a stone-built block of buildings, comprising COTTAGE, COACH-HOUSE, STABLING for 7 horses, with hay loft over.

The Estate has a frontage of over 1,000 ft. to Low Lane, in the township of Horsforth, on the southerly side.

It is well situated, being within ten minutes' walk of the Horsforth Station on the North-Eastern Railway, and about 20 minutes from Newlay Station, Midland Railway, and the Tramways connecting Leeds and Horsforth. Powers have also been obtained for laying an extension of the Leeds Tramways to within 5 minutes of the property.

Lot 2. The following NURSERY BUILDINGS, erected on a portion of land known as "St. Ann's Nursery," situate at No. 459, Kirkstall Road, in the City of Leeds:—

FIVE PROPAGATING and GROWING HOUSES, erected with one exception on brick foundations, and of the following dimensions:—

No. 1., 80 ft. 6 in. long, with 24 ft. span, including office;
No. 2, 70 ft. long, with 26 ft. span;
No. 3, 70 ft. long, with 24 ft. 6 in. span;
No. 4, 70 ft. long, with 24 ft. 6in. span;
No. 5, 70 ft. long, with 24 ft. 6 in. span;
each having brick-edged planting beds, and Nos. 1, 4, and 5, brick and stone stages all round.

CORRIDOR, 92 ft. 6 in. long, with 12 ft. span, communicating with the foregoing.

LEAN-TO 70 ft. long, with 7 ft. 9 in. span, and brick-staging full length.

Another OFFICE & POTTING SHED, 27 ft. long and 22 ft. 6in. wide, former fitted with store cupboards and desk, and latter with iron tank for pot-washing purposes, and fixed benches.

The apparatus for heating all the foregoing comprises 2 of Kinnell's "Rochford" 1906 B pattern boilers, with water circulating and supply tanks as fitted on the Gould system, and over 3,500 ft. of 4-in. hot-water piping, 144 ft. of 3-in. and 815 ft. of 2-in. ditto, recently overhauled and refitted by Newton, Chambers and Co., Sheffield.

Also brick-built CHIMNEY, 20 ft. high, 8 sunk WATER TANKS, fitted with piping and taps, giving town's water supply, complete.

The site upon which the above erections stand is held by the Vendor under a lease for a term of 10 years from the 1st January, 1906, and a lease for a further period of years will be granted by the lessors to an approved purchaser.

There is a capital stone-built RESIDENCE, with 6 rooms and cellar, upon the Nursery site, which is included in the tenancy therewith at a net annual rental of £31 for the whole.

Lot. 3.—FOURTEEN PROPAGATING & GROWING-HOUSES, respectively numbered 6 to 19, six of which are each 78 ft. 6 in. long and 13 ft. wide, one 78 ft. 6 in. x 12 ft., five 70 ft. x 13 ft., one 70 ft. x 12 ft., and the remaining one 66 ft. x 13 ft., heated by an "deal" Sectional Boiler, Pattern No. 4 B, in 9 sections, and fixed new in January last, with water circulating and supply tanks, fitted on the Gould system, with 3,205 ft. of 4-in., 475 ft. of 3-in., and 2,460 ft. of 2-in. hot-water piping, recently re-arranged, and fitted by Newton, Chambers, and Co.; also 14 town's water supply tanks, with piping and hot and cold water taps complete, and brick and stone staging in nine of the houses

In addition are 3 wood-built STORE SHEDS, respectively 26 ft. 6 in. x 14 ft., 14 ft. 3 in. x 10 ft. 3 in., and 13 ft. x 6 ft. 9 in.

These several erections are on a plot of land adjoining Lot 2, and held under a yearly tenancy, at the annual rental of £12

To each lot is a considerable tract of standing-out ground, with town's water laid on.

The properties comprising Lots 2 and 3 have good frontages to an important main road, are within easy reach of Leeds and Bradford markets, and the Railway Stations of all systems, and have been established as Nurseries, and very successfully run as such by the late Mr. Featherstone for many years.

The purchaser will be given the option of acquiring at a fair valuation any Nursery Stock in land, houses, or frames, of either lot.

Any of the premises may be inspected at any time by arrangement through Telephone No. 139 Headingley, or by letter addressed to 459, Kirkstall Road.

Plans of Lot 1, and the Conditions of Sale, may be seen within 7 days of the date of Sale at the offices of

Messrs. ARMITAGE & SPEIGHT, Solicitors,
5, Greek Street, Leeds.

Auctioneers' Offices: 81, Albion Street, Leeds.

BULBS.

ARMITAGE'S, HUDDERSFIELD

Can supply you with the very finest Bulbs it is possible to produce. During the past few years we have made Bulbs one of our specialities, sending out only the very best quality, and seeing our output has increased about ten times without advertising, proves the quality of our bulbs.

To give some idea of the size, we may say that such varieties of Daffodils as Emperor (very fine), Golden Spur, Sir Watkin, etc., average nearly 3 blooms per bulb. Dutch Hyacinths and Tulips are quite equal in quality, although, of course, they only produce one spike.

As regards prices, we do not, and never shall, attempt to compete merely in this respect, as our first aim is to supply absolutely the best article, and if intending purchasers could only see the Bulbs we offer, we are sure they would decide our prices very reasonable.

Our new 1913 BULB CATALOGUE will be posted free on application to—

ARMITAGE'S, SEEDSMEN,
HUDDERSFIELD.

10 per cent. Cash Discount. 15

Fruit Roses, 6½ acres. Trees, Shrubs.

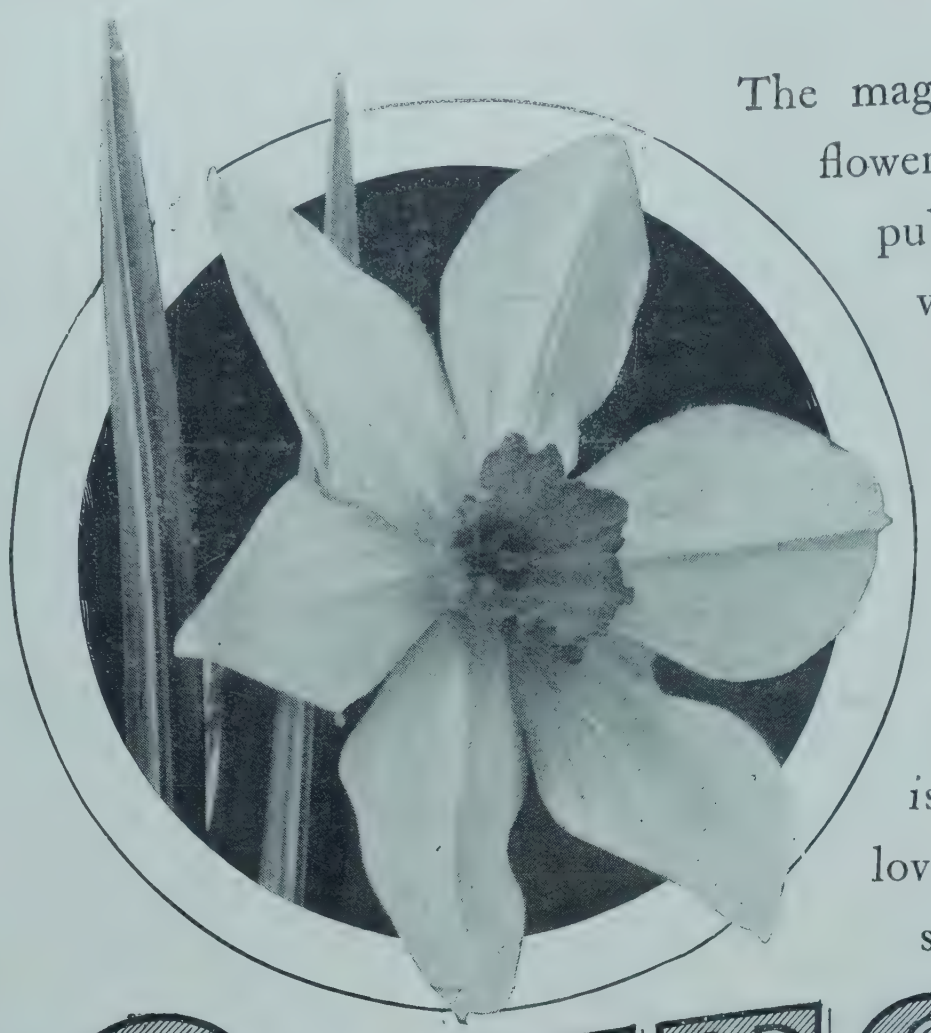
Owing to the expiration of the lease of part of one of our Nurseries, these superb trees, etc., are being offered at reductions of

10% on orders under £5 and
15% if over.

The ground must be cleared by March, 1914. A very large demand is expected, and we would **urge your immediate application for Price List.**

These trees are growing at about 350 feet above the sea level, on stony land, and are hardy and fit to transplant into any locality.

HILLIER & SONS,
The Nurseries.
WINCHESTER.



The magnificent displays of spring-flowering bulbs in private and public gardens demonstrate their value for the beautifying of beds and borders at a season of the year when pure and brilliant colours are most welcome. Their value for the decoration of rooms, conservatories and greenhouses is also fully recognised. No lover of these charming flowers should be without a copy of

SUTTON'S BULBS.

To ensure success at the Royal Horticultural Society's Show and other great Exhibitions next spring it is imperative that the very best Bulbs be secured now. As specialists in Bulb Cultivation Messrs. Sutton have spared no trouble or expense to place before their ever-increasing circle of patrons and friends the finest Bulbs of the year, and they advise intending purchasers to make their selections at once and thus avoid disappointment. Advice as to the best varieties of Hyacinths, Tulips, Narcissi, etc., for Show purposes may be obtained from—

MARKETS.

COVENT GARDEN, September 10.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Moss, gross bunches	6 0	—
Myrtle, doz. bnchs. (English), small-leaved	6 0	—
— French	1 0	—
Smilax, per bunch of 6 trails	1 0-	1 3

Remarks.—Business has improved, and after the few sunless days prices have risen rapidly, especially for Liliums, which advanced in two days from 9d. to 2s. per bunch; but since Saturday their value has gradually been on the decline. These remarks also apply to some of the hardy flowers. First-class blooms are not so plentiful, and certain "packs" of Carnations, Chrysanthemums, Gladioli, and Roses are all advancing in price. Physalis is more plentiful and the quality is better. Honesty has made its appearance. Prices are firmer all round for Carnations and Roses, but there is an abundant supply of second-quality blooms. Michaelmas Daisies are arriving in large quantities, and Violets have increased in numbers, but there is no special demand for either of these flowers. There is the usual quantity of foliage and the prices show no alteration.

Plants in Pots, &c.: Average Wholesale Prices.

	s. d.	s. d.
Aralia Sieboldii, dozen	6 0-	7 0

Latania borbonica, per dozen	12 0-	30 0
Lilium lancifolium rubrum, per dz.	12 0-	18 0
— lancifolium album	15 0-	18 0
— longiflorum, per dozen	12 0-	18 0
Lily-of-the-Valley	18 0-	21 0
— 48's, per dozen	21 0-	30 0
Marguerites, in 48's per doz., white	5 0-	6 0
Pandanus Veitchii, per dozen	36 0-	48 0
Phœnix rupicola, each	2 6-	21 0
Spiræa japonica, per dozen pots	6 0-	8 0
— pink	10 0-	12 0
Verbena Miss Willmott, 48's, per dozen	5 0-	6 0

Remarks.—There is better selection for buyers, the fresh subjects being Cyclamen, Erica gracilis (pink), Erica nivalis (white) in "forty-eights," and Solanums of good quality. Chrysanthemums and Asters are arriving in larger numbers, and the same remark applies to Ferns. There is a general improvement in trade all round.

— German, Switchen, per ½ sieve	1 6-	2 0
— Pond's Seedling per ½ bushel	5 0-	7 0
— Damsons, per ½ bushel	7 0-	10 0

Remarks.—English cooking apples are arriving daily in large quantities, Lord Derby forming the bulk of the supplies. Dessert varieties include Worcester Pearmain, Charles Ross, James Grieve, and Lady Sudeley. English Pears are a short supply, but there are some fine samples of these fruits from California in cases, consisting of the varieties Williams' Bon Chrêtien and Beurré Hardy. Plums are arriving from English and Continental sources. English varieties now obtainable are Pond's Monarch, Cox's Emperor and Bush. Damsons are very scarce, whilst supplies of Greengages (English and Spanish) are only moderate. Large quantities of Grapes from English and Continental growers are arriving daily and the bunches are at their lowest value. Muscat and Canon Hall varieties are plentiful, selected bunches making good prices. English and Continental Figs are available in fairly large quantities. Supplies of Melons from home and Continental growers are moderate. Peaches and Nectarines are, as usual at this season, a limited supply. Tomatos (English and Continental) continue plentiful, but many of the fruits lack good colour. Cobnuts are now available, also walnuts from the Continent. Outdoor Mushrooms are very plentiful, but cultivated Mushrooms are only a moderate supply. Vegetables generally are a very limited quantity, especially Beans, Marrows, Cabbage, and Cauliflowers.

New Potatos.

	s. d.	s. d.		s. d.	s. d.
Bedford, per cwt.	3 6-	4 3	Kent, per cwt.	4 0-	4 6

THE WEATHER

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 6, is furnished from the Meteorological Office :—

WEEKLY REMARKS.

September 9, 1913.

Weather.—In Scotland, the north-west of England, North Wales, and a large portion of Ireland the weather was dry throughout, but in the south-west, south and south-east of England heavy falls of rain were experienced, in some places on August 31, in others on September 4 or 5. Thunderstorms occurred in the east of England on September 1, and at some stations in the extreme south-west on the 5th.

Temperature was rather above the average generally, but a little below it in Scotland N. and E. The highest of the maxima were recorded at most stations during the latter half of the period, and ranged from 74° in the English Channel to 68° in Scotland E. and England N.W. The lowest of the minima, which occurred on irregular dates, varied from 34° in Scotland E. and 36° in England N.W. to 50° in England E. and S.E., and to 54° in the English Channel. The lowest grass readings were 30° at Newton Rigg, 31° at Balmoral, and 32° at Armagh. Over the country generally the temperature of the earth was above the normal at a depth of 1 foot, and in most parts of the Kingdom it was above it at a depth of 4 feet also.

Rainfall.—In Scotland and in England N.W., there was practically no rain, and in Ireland less than 0.1in. In the south and south-west of England, however, there was a great excess. On Sunday more than an inch fell over a large portion of the southern counties, the largest measurements being 1.4in. at Hastings, Brighton and Westbourne, 1.76in. at Portland Bill, and 2.47in. at Worthing. Further heavy falls were recorded on the 4th; 1.57in. at Bath, 1.69in. at Worthing, 1.70in. at Cardiff, and more than 1.0in. at many other places.

Bright Sunshine was much less than the average, except in Scotland N., where the daily mean was 5.8 hours, and the percentage of the possible duration 42, or 16 per cent. above the normal. In all parts of England except the north-west, the daily mean was less than 2 hours, and in England S.E. it was no more than 0.6 hour. In the latter district the percentage of the possible was only 5, in England E. 7, and in the Midland Counties 10.

Barometer and Wind.—The distribution of pressure was anti-cyclonic, the highest barometric readings being found to the northward of these islands, while shallow depressions existed over the southern counties, the Netherlands and the north of France. The wind was consequently from some point between north-west and north-east, and, as the barometric gradient was generally slight, there was little force. Late in the week, however, a fresh to strong breeze sprang up on the Channel and the south-eastern coasts.

THE WEATHER IN WEST HERTS.

Week ending September 10.

A Warm Week.—Throughout the past week the days have been on the whole warm, while the nights have proved very variable. On the first two nights of the week the exposed thermometer did not fall below 56°—a very high minimum reading for the month. On the contrary, on the last two nights the same thermometer indicated readings within respectively 7° and 4° of the freezing point. At 2 feet deep the ground is now of about seasonable warmth, but 1° colder than the average at 1 foot deep. Some rain fell on three days, but to the total depth of less than ¼ inch. Small quantities of rainwater came through the bare soil percolation gauge on each of the first two days of the week, but since then no measurable quantity has passed through that gauge. The sun shone on an average for three hours a day, which is about two hours a day short of the mean daily duration for the beginning of September. On the one bright day the sun was shining for 10½ hours, while on three other days only one hour's sunshine was altogether recorded. For the thirteenth week in succession the winds proved very light, and on the calmest day the mean velocity at 30 feet above the ground was only a quarter of a mile an hour. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 9 per cent. *E. M., Berkhamsted, September 10, 1913.*

NOTICE!

Royal Exotic Nursery,
CHELSEA, LONDON, S.W.

We beg to announce that we are retiring from business as Seed Merchants from the 30th September, 1913, and that we are selling to Messrs. Sutton & Sons the Seed portion of the business hitherto carried on under the title of James Veitch & Sons at Chelsea and elsewhere for the past sixty years and upwards, with all our stocks of seeds on hand or to be harvested, together with that portion of the freehold Seed Grounds adjoining the G.W.R. Line at Slough. It is our earnest hope that those customers whose confidence we have so long enjoyed and with whose orders for seeds we have been favoured in the past, will in future transfer those orders to Messrs. Sutton, who we feel sure will give them every possible attention. By so doing our customers will ensure for themselves seeds equal to and identical with those we have so long supplied.

For JAMES VEITCH & SONS, LTD.,

Harry J. Veitch

Managing Director.

September 9th, 1913.

Royal Seed Establishment,
READING.

We have the pleasure to announce that we have arranged with our friend, Sir Harry Veitch, the Managing Director of Messrs. James Veitch & Sons, Ltd., of Chelsea, to take over the Seed business as hitherto carried on by that old established firm together with the freehold Seed Grounds adjoining the G.W.R. Line at Langley, near Slough, as a going concern as from the 30th September, 1913.

It will thus be possible for Messrs. Veitch's customers in future to secure through us the identical stocks of Vegetables, Flowers, Grasses and Sundry Roots, &c., to which they have been accustomed, and at similar prices, while they will further have the benefit of the special advantages we offer our customers of free carriage by post and rail and free package of goods.

Sutton & Sons

MARKETS.

COVENT GARDEN, September 17.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Myrtle, doz. bnchs. (English), small-leaved	6 0	—
— French	1 0	—
Smilax, per bunch of 6 trails	1 0	1 3

REMARKS.—There is very little alteration in business or prices. The market is glutted with hardy flowers, especially White Asters, and these are sold very cheaply. Chrysanthemums are taking the place of Asters. Bunches of white spray blooms sell fairly well, but there is no demand for coloured varieties. Large specimen blooms, both white and coloured varieties, are not realising much. There is a good supply of Carnations, Roses, Liliums, Stephanotis, Lapagerias, Physalis, Tuberoses, Lily-of-the-Valley, and Violets, including the variety Princess of Wales. Selected Rose blooms on long stalks and in the bud stage, suitable for transit, are realising better prices. The leading varieties are Madame Abel Chatenay, Richmond, Liberty, Bulgaria, President Carnot, Sunburst, Kaiserine Augusta Victoria and Mrs. John Laing. Prices for Roses have advanced a little all round. Supplies of some of the varieties may be expected to decrease gradually from now.

Plants in Pots, &c: Average Wholesale Prices.

	s.d.	s.d.
Aralia Sieboldii, dozen	6 0	7 0
Araucaria excelsa, per dozen	18 0	21 0

— Damsons, per ½ bushel	7 0	7 6
Pomegranates, per case	3 6	4 6
Sloes, per chip	2 0	2 6

REMARKS.—Heavy consignments of English cooking Apples are arriving daily, the principal varieties being Lord Derby and Warner's King. Best samples English dessert varieties are in demand. The supplies of Plums are shortening; the varieties consist of Pond's Seedling, Monarch, and Magnum Bonum. There are also Zwetschen Plums from Germany, and others from California, which are selling freely. Good quality English Pears are in demand. American Pears consist of the varieties Beurré, Hardy, and Bartlett. Damsons are a short supply and dear. Large consignments of English and Continental Grapes arrive daily. Figs from home and Continental growers are available in large quantities. There is a fairly good supply of English and Continental Melons, but Peaches are a limited supply. English and Continental Tomatos are plentiful and cheap. The supplies of Cobnuts and Walnuts are limited. Ordinary vegetables are scarce and in demand.—*Edgar H. Rides, Covent Garden, September 18, 1913.*

Mr. SIDNEY LEGG, General Foreman in the gardens at Warter Priory, as Gardener at Newstead Abbey, Nottingham.

Mr. JOHN BLAKEY, Gardener to CHAS. CROYSDALE, Esq., as Gardener to T. H. PRATER, Esq., Hicklam House, Aberford, Leeds.

THE WEATHER

THE WEATHER IN WEST HERTS.

Week ending September 17.

Warm, Dry, and Exceptionally Calm.—The past week was on the whole a warm one. There occurred during the course of it only two cold days, and but two cold nights. On the two cold nights, however, the exposed thermometer fell to the freezing point. The ground is at the present time 1° colder at 2 feet deep, and 2° colder at 1 foot deep than is seasonable. Some rain fell on three days, but to the total depth of littl emore than one-tenth of a ninch. No rainwater at all has come through either of the percolation gauges during the week. The sun shone on an average for 5¼ hours a day, which is half an hour a day longer than the mean duration for the middle of September. On each day some sunshine was recorded, and on two consecutive days the sun was shining brightly for more than eight hours. For the fourteenth week in succession the winds have been very light. In fact, with the exception of a few hours on the morning of the 14th the weather remained during the past week nearly calm; these light airs came almost entirely from S.S.E. The average amount of moisture in the air at three o'clock in the afternoon fell short of a seasonable quantity for that hour by 6 per cent. *E. M., Berkhamsted, September 17, 1913.*

SITUATIONS VACANT.

Four Lines 5s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

WANTED at once, for Cornwall, HEAD GARDENER (seven kept); Vineries, Peach Houses and Plant Houses; must be specially good at Colour Grouping and Massing in Herbaceous Borders, also at Rock Garden work; excellent cottage and good wages.—State wages and fullest particulars, MISS FEARNLEY, Horticultural College, Swanley, Kent.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."

—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."

—*The Nurseryman and Seedsman.*

The DAFFODIL

QUEEN of the EARLY SPRING FLOWERS.

THE MOST GRACEFUL AND MOST DECORATIVE OF THEM ALL.

SUTTON'S DAFFODILS AND NARCISSI.

The selections offered below cannot be equalled for producing brilliant masses of colour by the banks of streams and ponds, under trees, in woodland gardens, orchards, shrubberies, borders, and among grass. Clumps should also be grown in corners to furnish flowers for indoor decoration.

BY APPOINTMENT TO HER MAJESTY QUEEN ALEXANDRA.

CARTERS "KING ALFRED" DAFFODIL.

The Great Trumpet Daffodil of the South.

Height 2 ft. Price **2/-** each. **24/-** per doz.

First Class Certificate R.H.S.

First Class Certificate, Boston, U.S.A.

The Trumpet is a deep, pure yellow (the colour of old gold), and the mouth is turned well back and is beautifully frilled.

DAFFODIL SIR FRANCIS DRAKE.

An exceedingly early and robust-growing Trumpet Daffodil, raised by the same grower as our celebrated *King Alfred*, coming earlier into bloom, and quite distinct in character.

The flowers are as large as *King Alfred*, and stand on stems two feet high, in colour similar to *Emperor*, but rather deeper, and very refined and beautiful in form, with splendid green foliage.

It was the centre of attraction at the Spring Show of the Royal Horticultural Society last season.

Price 3s. 6d. each.

NARCISSUS SIR WATKIN.

Incomparabilis (3)

THE GIANT WELSH DAFFODIL.

This beautiful variety is the largest and most free flowering in the Incomparabilis section, and should be grown by every lover of Daffodils. It has a wide sulphur perianth, with deep yellow cup, and is an effective and striking flower. Specially recommended for bedding

GARDENING FOR PROFIT.

What "THE GARDENERS' CHRONICLE" says about "COMMERCIAL GARDENING."

"Mr. John Weathers, as editor, and the Gresham Publishing Company as publishers, may be congratulated upon having brought out a very successful work on Commercial Gardening. . . . Examination confirms the favourable impression made by the appearance of the volumes, as it shows that the work is by far the most comprehensive one on its subject ever published in this country. So comprehensive, indeed, is it that it might fairly have been entitled

"The Encyclopædia of Commercial Gardening."

It explains how to grow, what to grow, and where to grow. It expounds the best cultural methods, the best marketing methods, the best book-keeping methods, and the best packing and grading methods.

Edited by

JOHN WEATHERS, F.R.H.S.,

and contributed to by

Amos Arthur	**William G. Lobjoit, J.P.**
Wilfred E. Bear	**George Massee, F.L.S.**
A. J. Bridges	**John May**
Percy A. Cragg	**Sir Frederick W. Moore, M.A., F.L.S.**
Charles T. Druery	**James B. Riding**
Carl Englemann	**Prof. F. T. Theobald, M.A.**
John Fraser, F.L.S.	**William Truelove**
Geo. Gordon, V.M.H.	**James Udale**
James E. Hill	
J. M. Hodge	
E. H. Jenkins	

While there are gardening books in plenty, this is the only book dealing with *commercial* gardening. It is "commercial" in every sense of the word, because it deals with gardening from the point of view of the man who grows plants for a profit. It is also "gardening" in the best sense, because the cultural methods of the best market growers are detailed. It considers gardening from the standpoint of "pounds, shillings and pence."

SYNOPSIS OF CONTENTS.

General Aspects of Commercial Gardening—The Science of Plant Growing—Methods of Propagation—Science of Soil—Manuring—Insect Pests—Garden Friends—Fungoid Diseases—Fungicides and Insecticides—Glass-house Building—Heating Apparatus—Hardy and Half-Hardy Herbaceous Plants, Bulbs and Flowers—Stove and Greenhouse Plants—Ferns—Commercial Fruit Growing—Fruit Growing in Worcestershire, Scotland and Ireland—Fungi Disease in Fruit—Grading and Packing—Pip Fruits—Stone Fruits—Small and Bush Fruits—Figs—Grapes—Nuts—Melons—Garden-Surveying, Levelling, and Mensuration—Market Garden Accounts—Trees, Shrubs, and Climbers—Conifers and Taxads—Vegetable Growing for Market—Sweet Herbs and Small Salads—Intensive Cultivation—Index.

BOOKLET FREE.

THE

Professional Gardener's Cultural Guide.

Thompson's

GARDENER'S ASSISTANT.

Edited by

W. WATSON, A.L.S.,

Curator of Kew Gardens.

Read this book now, for during winter you have most time for indoor study. The result will be that next season your work will be enormously benefited, because you will act upon the advice of the following TWENTY-SIX authorities:—

W. J. BEAN, F.R.H.S.	G. MASSEE, F.L.S.
E. BECKETT, V.M.H.	Dr. M. T. MASTERS, F.R.S.
J. BOYD, Junr.	E. F. R. MAWLEY, F.M.S.
F. W. BURBIDGE, M.A.	G. T. MILES, F.R.H.S.
R. LEWIS CASTLE	F. MOORE
W. CRUMP, V.M.H.	J. O'BRIEN, F.L.S.
R. DEAN, V.M.H.	A. PIPER
W. H. DIVERS, F.R.H.S.	H. C. PRINCEP
J. DOUGLAS, V.M.H.	J. SMITH, V.M.H.
J. FRASER, F.L.S.	W. SPINKS
A. HEMSLEY, F.R.H.S.	A. WARD, F.R.H.S.
J. HUDSON, V.M.H.	J. J. WILLIS
W. IGGULDEN, F.R.H.S.	
J. M'INDOE, V.M.H.	

FRUIT, FLOWER, & VEGETABLE CULTURE from A to Z.

To adequately convey what so large a work contains would require pages of *The Gardeners' Chronicle*, for it is a veritable storehouse of horticultural information. The following much abridged List of Contents will give some indication of its wide scope:—

Meteorology—Plant Structure—Nutrition—Growth and Branching—Reproduction—Hybridisation—Classification—Insect and Other Plant Enemies—Plant Diseases—Soils—Manures—Tools and Instruments—Garden Structures—Heating—Propagation—Transplanting—Pruning—Flower Gardens—Ornamental Trees and Shrubs—Herbaceous Perennials—Aquatic and Bog Plants—Hardy and Half Hardy Annuals—Greenhouse and Conservatory—Stove and Tropical House—Orchids—Ferns—Palms and Cycads—Shrubs, Plants, and Bulbs for Forcing—Retarding Plants—Spring, Summer, and Carpet Bedding—The Sub-tropical Garden-Orchards—Spraying Fruit Trees—Orchard Houses—Preserving, Packing and Storing Fruits—Vegetables—Index (giving common and classic names).

FULL INDEX.

"The Gardener" says:—

"There is **no better book** for a gardener's library than this."

"The Field" says:—

"Will long continue to be **the fullest and best general book of reference** on fruit, vegetable and flower gardening in the British Islands."

ILLUSTRATED PROSPECTUS FREE.

To the Gresham Publishing Company,
34-5, Southampton Street, Strand,
London, W.C.

Please send me the illustrated prospectus describing THOMPSON'S GARDENER'S ASSISTANT, and details of special terms enabling readers of *The Gardeners' Chronicle*, to obtain the work at once on payment of a nominal deposit.

MARKETS.

COVENT GARDEN, September 24.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—The Flower Market is in an unsettled state. There is a glut of common and second-rate subjects, and poor prices are realised. Asters are commencing to show the effect of the cold damp nights. The choice and better-class flowers are as scarce as the others are plentiful, such as Lily-of-the-Valley, Stephanotis, Lapagerias, Pancratium, Tuberoses; and this week Lily-of-the-Valley has reached a very high figure, but this is only for a short period. The supply on Saturday and Monday was exceptionally short. Liliums are scarcer, but the quality remains good. Gladiolus are practically finished for this season, but there is still a demand for Brenchleyensis; this is chiefly required for festival purposes at this time of the year, therefore realises a good price. Many of the Chrysanthemum specimen blooms are soft, and are quickly affected by the damp; they are being sold at low prices in order to clear. Bunches of spray blooms, white Roi des Blancs, are selling better, and Crawford White; but there is no demand for coloured varieties. Special Roses and Carnations are firmer. Violets: Princess of Wales is improving in quality, but they do not last this mild weather; the small variety sells more freely, but these will improve when the weather is more suitable.

— Damsons, per ½ bushel	8 0	10 0
Pomegranates, per case	3 6	4 6
Sloes, per chip	2 0	2 6

REMARKS.—There is a full supply of English culinary Apples from all sources, and a fair demand for large samples, Warner's King and Lord Derby being exceptionally fine this season, coloured samples of dessert varieties being in demand. English Plums are practically finished, the only varieties obtainable being Monarch and Pond's Seedling. There is a short supply of Damsons, and they are realising high prices. Californian Plums are plentiful; German Zwetchens are nearly finished. Fine samples of English and dessert Pears are in demand. Californian Grapes are plentiful, and there is a large supply of English and Continental varieties, but there is slow demand for them. English and Continental Peaches and Nectarines are finished. English, Guernsey and Continental Figs are plentiful. Consignments of English and Continental Melons are decreasing, and they meet with a slow demand. English Cobnuts are scarce and dear. English and Continental Walnuts are a fairly good supply. English and Continental Tomatos are plentiful. Blackberries are plentiful from all sources. The vegetable trade is slow this week, but fairly good supplies are to hand. Trade is generally quiet.—*Edgar H. Rides, Covent Garden, September 25, 1913.*

Potatos.

THE WEATHER

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 20, is furnished from the Meteorological Office :—

GENERAL REMARKS.

September 23, 1913.

Weather.—The general condition was very unsettled, with frequent, and in some places very heavy, falls of rain. Thunderstorms were experienced in many places in the eastern half of England, at some stations in the north-west, and at Crieff.

Temperature was below the average, except in England North-east and East, the difference amounting, in Ireland South, to 2½°. The highest of the maxima, which were registered mostly between the 17th and 19th, varied from 71° in the Midland Counties and England South-west, to 62° in Scotland North. The lowest of the minima occurred about the middle of the period, and were as low as 31° in Scotland West, 32° in England North-west, and 33° in Scotland East. Elsewhere they ranged from 35° in Ireland and some parts of England to 47° in the English Channel. The lowest grass readings were 27° at Harrogate, 28° at Birmingham, and West Linton and Armagh, and 29° at Worksop and Greenwich. The temperature of the soil was, as a rule, above the normal both at a depth of 1ft. and 4ft., but the excess was slight.

Mean Temperature of the Sea.—On nearly all parts of the coast the water was warmer than during the corresponding week of last year, the mean values ranging from 60.9° at the Shipwash Lightship, and 60° or above at Newquay, Plymouth and Eastbourne to 52.6° at Lerwick, and to 52.4° at Lamlash. In most localities the temperature was above the normal.

Rainfall was more than the mean, except in Scotland North and West and England North-west, where there was a considerable deficiency.

Several parts of the Kingdom experienced more than an inch within 24 hours, the largest measurements being 1.4 inch at Killarney on the 14th, 1.2 inch and 1.8 inch at Gordon Castle and Roche's Point on the 15th, 1.2 inch and 2.1 inches at Lincoln and Bawtry on the 17th, and 1.7 inch at Dublin on the 19th.

Bright Sunshine exceeded the average in Ireland and the adjacent districts of England, as well as in England North-east, and just equalled it in England East. Elsewhere it was below the normal. In Scotland North the daily mean was only 0.7 hour, and the percentage of the possible only 6, but in many parts of England and the South of Ireland the corresponding values were 4.9 hours and 40, while in the English Channel they were as large as 7 hours, and 57.

Barometer and Wind.—At the beginning of the week the centre of a depression lay over North Wales, and the cyclonic circulation of the wind was well marked, fresh to strong breezes being reported on various parts of the coast and a gale at Malin Head. Later the disturbance moved slowly in a westerly direction to the West of Ireland, and then south-eastwards towards the Bay of Biscay, gradually decreasing in intensity; while the wind, after reaching gale force on some parts of the western and northern coasts, quickly subsided. Late in the week another depression arrived over these islands from the westward and moved eastwards to the North Sea. It caused no great increase in the force of the wind, but was accompanied by considerable quantities of rain.

THE WEATHER IN WEST HERTS.

Week ending September 24.

Rather warm, very sunless, and remarkably calm.—This was on the whole a moderately warm week, and on no night did the exposed thermometer fall below 37°. The ground is at the present time at about a seasonable temperature, both at 1 foot and 2 feet deep. Rain fell on four days, and to the total depth of nearly ¾ inch, which is little more than an average quantity for a week at this period of the year; and yet, to show how dry the weather has been the last five months, on only two other weeks in that period has so large an amount of rain fallen. Even in those two weeks only a very moderate quantity of rain fell. A few drops of rainwater have come through the bare soil percolation gauge on each of the last five days, but there has been no percolation at all through that on which short grass is growing since the middle of May, or for over four months. The sun shone on an average for 2½ hours a day, which is little more than half the average duration for the same period in September. This was again a calm week. The first two days were remarkably calm, the total movement for those 48 hours being only about three miles, making these two days the calmest in September of which I have here any record. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 1 per cent. *E. M., Berkhamsted, September 24, 1913.*

GARDENING APPOINTMENTS.

Mr. A. JEWELL, for the past six years Gardener to H. RAMSBOTHAM, Esq., Crowborough Warren, Sussex, as Gardener to THOS. H. MANN, Esq., Trulls Hatch, Rotherfield, Sussex. [Thanks for 2s. for the R.G.O.F. box.—EDS.]

Mr. M. R. DOWDING, for nearly 5 years Gardener to G. R. LEYLAND, Esq., as Gardener and Bailiff to the LADY PIGOTT, Wexham Park, Slough, Buckinghamshire.

Mr. C. BOORMAN, as Gardener to H. RAMSBOTTOM, Esq., Warren House, Crowborough, Sussex.

Mr. ARTHUR WM. MALPASS, for 3 years General Foreman at Hillsborough Castle, Co. Down, previously of Bramham Park, and Nostell Priory, Yorkshire, as Gardener to Viscount BANGOR, Castle Ward, Strangford, Co. Down. [Thanks for 1s. for the R.G.O.F. box.—EDS.]

Mr. ALFRED MADDOCK, for the past 2½ years Gardener to S. B. BAMFORD, Esq., Hawthorndene Manor, Uttoxeter, as Gardener to JOSEPH HOULT, Esq., The Rocklands, Thornton Hough, Cheshire.

DEBATING SOCIETIES.

CROYDON AND DISTRICT HORTICULTURAL.—The annual outing took place on Wednesday, the 27th ult., when about 60 members availed themselves of the kind permission of one of their vice-presidents, Mr. C. Hay Walker, to visit his gardens at Frensham Hill, near Farnham. The fortnightly meetings were resumed on Tuesday, the 2nd inst., at the Sunflower Temperance Hotel, George Street, Croydon. Mr. A. Alderman, Selhurst, read a paper on the "Culture of the Violet."

EGHAM AND DISTRICT GARDENERS'.—At the meeting held on the 3rd inst. Mr. G. West, the Gables Nursery, Datchet, Buckinghamshire, read a paper on "Perpetual Carnations." December, January and February, said Mr. West, are the best months in which to insert the cuttings, which should be taken from about half-way down the old plant, pulling them from the joints and inserting them in red sand in a propagating case provided with a bottom heat of 55°. The plants should be potted finally in May and June in 6 or 7 inch receptacles, the compost to consist of good loam, manure from a spent mushroom bed, soot, mortar rubble, and a little bone meal. The final stopping of the shoots should not be done later than the middle of July; in the case of such varieties as Carola and R. F. Felton, not after May.

WATFORD HORTICULTURAL.—The fifty-seventh monthly meeting of the above society was held on the 12th inst. at the Church Road Schools, Mr. J. Stirton presiding. A paper on "Gathering and Storing of Fruit" was to have been given by Mr. G. Dyke, who wrote regretting his inability to attend. Mr. F. Newman, as he has done on previous occasions, very kindly acted as deputy and gave the members some useful and valuable hints on the subject, and answered a number of questions at the completion of his remarks. Mr. W. Henley read a paper on "Stove and Greenhouse Plants," and this also was followed by a discussion.

WARGRAVE GARDENERS'.—The opening meeting of the autumn session took place on the 10th inst. Delegates were elected to attend the conference on the second day of the Fruit Show at Westminster. The judges awarded certificates to the Wargrave Plant Farm for an exhibit of hardy flowers; also to Mr. J. A. Hall, of Shiplake Court Gardens, for Carnations. Mr. W. Wright, of Badgemore Gardens, read his essay, which won the 1st prize in the recent competition, the subject being Perpetual-flowering Carnations.

BATH GARDENERS'.—The fortnightly meeting of this society was held on the 8th inst. at the Foresters' Hall. Mr. T. Parrott presided. Three new members were elected. Mr. Rose, of the Newport Society, who was to have given a lecture on "Aquatic Gardening," was unable to be present. However, Mr. Sparey read a lecture on "Perpetual-Flowering Carnations." In the course of his paper he pointed out that Carnations were flowers that every florist demanded. In the Carnation there was a greater variety of colour than was found in any other species of plants. It also possessed a charming perfume and the flowers were capable of lasting in good condition for a considerable time. As to the time of rooting cuttings, he thought that December, January and February were the best months, because after they were potted they had the best part of four months to grow in, while if they are rooted in September they had the winter before them, and the result would probably be a weak plant. The young plant should be grown in a cool, light structure with a night temperature of about 50 deg. It was essential that the plant should have direct exposure to the light, and only be shaded from the strongest sun until it was established. The same plant could be flowered for two years. The greatest enemy of the Carnation was red spider, and it was one which was little noticed. The way to get rid of this enemy was to syringe it with clear water at a high temperature. The list of awards, which was larger than usual, was as follows:—Class I.—Onions, Peas, Tomatos, and Asters, J. S. Rivington, Esq. (gr. T. Ainsworth). Collection of vegetables, Miss Smart (gr. H. Griffin). Nine Peaches and nine Pears, Mrs. Hatch (gr. F. Allen). Class 2.—Collection of Potatos, Mrs. Erskine (gr. Mr. H. Roper). Special prize of 20 Runner Beans—1, Mr. C. Stone; 2, Mr. R. Duckworth. Collection of Hardy Cut Flowers, not for competition, exhibited by Messrs. Rich and Co., was awarded a first-class certificate.

BROUGHTY FERRY HORTICULTURAL.—The ordinary monthly meetings of this association were resumed after the summer vacation on the 16th inst. The president, Mr. James Bethel, presided, and Mr. William Grant, Fern Hall Gardens, delivered a lecture on his "Impressions of the International Horticultural Exhibition, Chelsea, 1912." The lecture, which was illustrated with upwards of 70 lantern slides, was a source of interest and pleasure, refreshing the memories of those who were fortunate in being present at the show, whilst others could not but feel regret that they had allowed the opportunity to pass. The monthly prize was awarded to Mr. D. Keillon, Seabourne Gardens, for a stand of 24 Cactus Dahlias.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."

—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."

—*The Nurseryman and Seedsman.*

THE WEATHER

The Following Summary Record of the weather throughout the British Islands, for the week ending September 27, is furnished from the Meteorological Office :—

WEEKLY REMARKS.

September 30, 1913.

Weather.—Over the greater part of England the weather was fair, but in Ireland, Scotland, and the northern districts of England rain was experienced on several days. A thunderstorm occurred at Little Massingham on the 22nd, thunder at Morpeth on the 26th, and thunderstorms at Lerwick and Valencia on the 27th. Mist was rather prevalent from time to time both on the coast and inland.

Temperature was above the average, the difference exceeding 6° in England N.E., E. and N.W., and amounting to more than 7° in the Midland Counties. The highest of the maxima were recorded at most stations, either on the 26th or 27th, and ranged from 79° in England N.E., the Midland Counties and England N.W., to 68° in Ireland N. The lowest of the minima, which occurred generally on the 21st or 22nd, varied from 36° in Scotland W., and 38° in Scotland N., and the Midland Counties, to 44° in Ireland and the north-east, east, and south-east of England, and to 50° in the English Channel. During the greater part of the week the minima were very high for the time of the year. The lowest grass readings were 32° at West Linton and 35° at Greenwich and Hampstead. The temperature of the soil was above the average at all stations at a depth of 1 foot, and, with very few exceptions, at a depth of 4 feet also.

Mean Temperature of the Sea was, as a rule, much higher than in the corresponding week of last year—as much as 6° at Eastbourne—and was generally above the average. The figures ranged from 62° at the Shipwash Lightship, 60.7° at Eastbourne, and about 60° at Plymouth and Salcombe, to about 53° at Lamlash and Lerwick, and to 52° at Burnmouth.

Rainfall exceeded the normal in Ireland and in England N.W. and N.E., but was less elsewhere. Some heavy falls in 24 hours were experienced in various northern and western districts. On the 22nd, 0.9 in. at Dublin, 1.1 in. at Roche's Point and Carrick-on-Suir, and 1.4 in. at Valencia; on the 26th, 0.9 in. at Southport, 1.3 in. at North Shields, and 1.6 in. at Lancaster; and on the 27th 1.1 in. at Blacksod.

Bright sunshine was above the average in England E. and S.E., but below it in all other districts. In England S.E., and the English Channel, the daily mean was 5 hours, and the percentage of the possible 42, but in Ireland S and Scotland W. the daily mean was only about 1.5 hour, and the percentage of the possible no more than 12.

Barometer and Wind.—Early in the week a high pressure system covered the Bay of Biscay region, and the gradient over these islands was very slight, but as a large depression advanced from the westward this anticyclone moved away to the eastward, and pressure became highest over Northern Europe. The Atlantic disturbance was large and rather deep, and, extending over the United Kingdom, it caused fresh to strong winds from the southward over a large area, and a gale at times on the extreme western and northern coasts. Towards the end of the week the gradient decreased, and the wind, which continued southward, fell to a light or moderate breeze.

THE WEATHER IN WEST HERTS.

Week ending October 1.

A very warm, dry, and sunny week.—This was a very warm week. All the days and nights were above the average in temperature, and on four consecutive days the highest reading in the thermometer screen exceeded 70°—a very high reading for the end of September. On no night did the exposed thermometer fall below 38°. The ground is at the present time 3° warmer at 2 feet deep, and 4° warmer at 1 foot deep, than is seasonable. No rain at all fell during the week. Each day a few drops of rainwater came through the bare soil percolation gauge, but none has come through that on which short grass is growing since the middle of May, or for four and a half months. The sun shone on an average for six and a quarter hours a day, which is two hours a day in excess of the usual duration at the end of September. Light airs and calms alone prevailed during the week, the direction of these light airs being almost exclusively some point between east and south. The mean amount of moisture in the air at three o'clock in the afternoon fell short of a seasonable quantity for that hour by 4 per cent. *E. M., Berkhamsted, October 1, 1913.*

GARDENING APPOINTMENTS.

Mr. John Waddup, for nearly six years Foreman at Bessborough, Piltown, Co. Kilkenny, as Gardener to The Rt. Hon. The Earl of Donoughmore, Knocklofty, Clonmel, Co. Tipperary.

PUBLISHERS' NOTICES.

"THE TOWN BEAUTIFUL."

TOWN PLANTING,

and the Trees, Shrubs, Herbaceous and other Plants that are best adapted for resisting smoke.

By A. D. WEBSTER, Regent's Park, London.

With 16 Full Page Plates. Crown 8vo 3/6.

This book is the outcome of an essay for which the Royal Scottish Arboricultural Society awarded their gold medal to the author, whose experience in London has afforded him exceptional opportunities of getting together a list of trees, etc., and of studying the conditions under which they may be most successfully cultivated.

GEORGE ROUTLEDGE & SONS, LTD.,

Broadway House, 68-74, Carter Lane, London, E.C.

TO SECRETARIES OF HORTICULTURAL SOCIETIES, ETC.

BEES LTD. have prepared a LANTERN LECTURE, entitled "PLANT COLLECTING IN THE LAND OF THE BLUE POPPY." It is an interesting account of the travels of Mr. F. K. Ward while collecting New Plants in China. The lecture is printed, and there are about 50 lantern slides. Bees Ltd. will be pleased to loan the slides, and send copies of the lecture free of charge to any society which may have convenient vacant dates. Applications should be made at once, mentioning, whenever possible, two or more alternative dates.

XL ALL! XL ALL! XL ALL!

RICHARDS' FUMIGATOR.

AUTUMN IS WITH US!

And Gardeners will be on the alert for Frost.

Plants which have been taken under glass, from the open, would be all the better for a vaporising with **XL ALL Compound,** or a syringing with **XL ALL Liquid Nicotine Insecticide Wash,** whichever method is most suitable and convenient. Mealy Bug and Scale on Vines and Fruit Trees can be speedily stamped out with one or two dressings of **Liquid Nicotine Insecticide.**

Hundreds of gardeners can confirm this statement. **XL ALL** is the best, most largely used, and popular Insecticide of the day.

Will gardeners kindly remember that although these preparations are what are known as poisonous, they can be ordered through any Nurseryman, Seedsman or Florist? Get in supplies with your Bulbs and Seeds! Most gardeners will know that **XL ALL Insecticide** is much more efficacious than the common soapy (non-poisonous) washes now so much advertised.

Prices, particulars, and supplies from Nurserymen, Seedsmen and Florists everywhere.

G. H. RICHARDS (XL ALL),

MARKETS.

COVENT GARDEN, October 29.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

— French	1 0	—
Smilax, per bunch of 6 trails	1 0-	1 3

REMARKS.—The short spell of cold and foggy weather we have experienced has had little effect on the supply of cut flowers, and in most cases the prices remain as last week. A few special Roses have advanced in price and are shortening somewhat. The Carnation trade is very slow. White and scarlet varieties are required mostly, but prices are low for this time of the year. Lilies-of-the-Valley, Stephanotis, Lapagerias and Roman Hyacinths hold very firm. Arum Liliums (pink and white), Camellias, Gardenias and Tuberoses are plentiful Violets Princess of Wales, which are exceptionally fine, have to be disposed of cheaply in order to clear. The supply exceeds the demand. Narcissus, Violets, Anemones, Ranunculus, Mimosa, Parmas are coming in larger quantities from the South of France, but the weather is much too warm for this class of stuff. Many baskets are useless on arrival, especially Violets, which travel so badly. The market is full of Chrysanthemums, both blooms and spray bunch stuff, and it is impossible to clear. There are also some fine exhibition blooms sold by Messrs. J. and E. Page. Messrs. Cragg and Harrison and J. Crouch are bringing some very fine single varieties. There has never been better stuff on the market.

Plants in Pots, &c.: Average Wholesale Prices.

— nivalis, per doz.	12 0-	18 0
— small, in thumbs, per dozen	4 0-	6 0
Ferns, in thumbs, per 100	8 0-	12 0
— in small and large 60's	12 0-	20 0
Ferns, in 48's, per dozen	5 0-	6 0
— choicer sorts, per dozen	8 0-	12 0
— in 32's, per doz.	10 0-	18 0
Geonoma gracilis 60's per dozen	6 0-	8 0
— larger, each	2 6-	7 6
Kentia Belmoreana, per dozen	5 0-	8 0
— Fosteriana, 60's, per dozen	4 0-	8 0
— — larger, per dozen	18 0-	36 0
Latania borbonica, per dozen	12 0-	30 0
Lilium lancifolium rubrum, per dz.	12 0-	18 0
— lancifolium album	15 0-	18 0
— longiflorum, per dozen	12 0-	18 0
Lily-of-the-Valley	18 0-	21 0
— 48's, per dozen	21 0-	30 0
Marguerites, in 48's, per doz., white	5 0-	6 0
Pandanus Veitchii, per dozen	36 0-	48 0
Phœnix rupicola, each	2 6-	21 0
Solanums, 48's per dozen	6 0-	10 0
Spiræa japonica, per dozen pots	6 0-	8 0
— pink	10 0-	12 0

REMARKS.—The plant trade remains very steady. Ericas are the leading feature. The small plants in thumb-pots are going out freely. Chrysanthemums are also good, and the best stuff is soon cleared. There is little alteration from last week for other lines.

Plums, Californian, per case	10 6-	12 0
Pomegranates, per case	3 6-	10 0

REMARKS.—Heavy consignments of English and overseas Apples, both dessert and culinary varieties, are arriving daily. Home-grown supplies of Pears are now limited. Pears from California, America, Holland and France are supplying the market with the following varieties: Doyenne du Comice, Glouts, Winter Nelis, Beurré, Bosc, etc. Keiffers in barrels form the bulk of the American supply. English and Continental Grapes are reaching the market daily in heavy consignments; in fact, Grapes are now at their lowest. Tropical fruits now available include Avacade Pears, Monsterias, Mangos, Custard Apples and Granadillas. Blackberries and Sloes are still available. Cobnuts are scarce. English and Continental Walnuts, both double and single, are a good supply. Italian and Redon Chestnuts are plentiful and exceptionally fine this season. Teneriffe Tomatos are now being shipped in good quality. Outdoor supplies of Mushrooms have increased during the past week. Dwarf Beans from Guernsey, France and Madeira are now on the market in excess of the demand. The ordinary vegetable trade is slow, with the exception of Sprouts and Cauliflowers.—*Edgar H. Rides, Covent Garden, October 30, 1913.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending October 28, is furnished from the Meteorological Office :—

GENERAL REMARKS.

Week ending October 28.

Weather.—The conditions were rather variable. Over most of England there was very little rain, and several bright periods were experienced in Ireland, Scotland and the Western districts of England, although rain fell more frequently. A thunderstorm occurred in the South of Ireland on the 20th, and at a few places along the southern coasts of England on the 21st. Late in the week a good deal of mist and fog was reported over England.

Temperature was above the average in Great Britain, the largest excess being 2.8° in England South-east. In Ireland it was below it—as much as 3° in the south. The highest of the maxima were registered, as a general rule, on the 19th or 20th, and ranged from 68° in England North-west and 67° in the English Channel to 62° in England East and to 61° in Ireland North. The lowest of the minima, which occurred late in the week, mostly on the 24th, varied from 24° in Ireland, at Birr Castle and Cahir, and 25° in Scotland East and West and England North-west, to 33° in England South-east, and to 44° in the English Channel. The lowest grass readings reported were 18° at Colmonell, 19° at West Linton, 20° at Carrick-on-Suir and Rauceby, and 21° at Newton Rigg, Stonyhurst and Markree Castle. The temperature of the soil was above the average at a depth of 4 feet and at a great majority of the stations it was also above at a depth of 1 foot.

Mean Temperature of the Sea.—The water was warmer than during the corresponding week of last year on all parts of the coast, and except at Wick and Scarborough the temperature was above the normal. The mean for the week ranged from about 57½° at Eastbourne, Plymouth and Salcombe, to about 50° at Burnmouth and Scarborough.

Rainfall exceeded the normal in England South-east and the English Channel, and also in Ireland and Scotland North, but was less elsewhere, the deficit being large in many localities. On the 19th about 1.1 inches fell at Armagh and Carrick-on-Suir, and on the 24th 1.57 inches at Fort William. In some parts of the Midlands and England North-east the total fall was less than 0.1 inches.

Bright sunshine was more than the average, especially in Scotland East and in Ireland. In Ireland South the daily mean was 6 hours, and in Ireland North rather more than 5 hours, the percentage of the possible duration being respectively 60 and 52. In England South-east and the Midland Counties the daily mean was less than 3.5 hours, and in Scotland North no more than 2.5 hours. The percentage of the possible in Scotland North was as low as 27.

Barometer and Wind.—Until Wednesday the pressure distribution over these islands and their neighbourhood was cyclonic, large depressions travelling northwards and north-eastwards on the Atlantic to the westward and north-westward of this country. The main wind current was southerly to south-westerly, and its force light or moderate. On the extreme north-western and northern coasts, however, it occasionally increased to a gale. From Thursday to the end of the week an anticyclone from the Atlantic passed eastwards over the United Kingdom, the wind becoming easterly or north-easterly in the south, south-westerly to westerly in the north, and very light and variable over the intervening regions.

THE WEATHER IN WEST HERTS.

Week ending October 29.

Another Warm Week, and the Sixth in Succession.—The first two days were of about average temperature, but during the rest of the week the weather remained very warm for the time of year. The first three nights proved cold, while the remaining four nights on the other hand were decidedly warm for the end of October. The ground is at the present time 3° warmer at 2 feet deep, and 4° warmer at 1 foot deep, than is seasonable. Rain fell on each of the last three days, but to the total depth of only about ½ inch. Two gallons of rainwater have come through the bare soil percolation gauge during the week, and for the first time for 5½ months a few drops have passed through the gauge on which short grass is growing. The sun shone on an average for 3¼ hours a day, or for half an hour a day longer than is usual at the same period in October. The first three days were very exceptionally calm—indeed, the total movement of the air at 30 feet above the ground during that period was only nine miles. During the rest of the week calms and light airs as a rule prevailed. The mean amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by 4 per cent. *E. M., Berkhamsted, October 29, 1913.*

DEBATING SOCIETIES.

WATFORD HORTICULTURAL.—The monthly meeting of this society was held on the 10th ult. at St. Andrew's Schools, Church Road, when the hon. treasurer, Mr. E. S. Theobald, presided. A paper on "Forcing Bulbs and Shrubs" was read by Mr. W. B. Kettle, and Mr. W. G. Taylor delivered a paper on "Lifting and Storing Vegetables." Excellent groups of Ferns and Orchids were exhibited by Mr. Alwyn Harrison, including a noteworthy specimen of Odontioda Bradshawæ. The society's autumn show was held at the Clarendon Hall.

KILMARNOCK AND DISTRICT GARDENERS'.—At a meeting on October 24, Mr. W. P. Lasham, of Messrs. Sutton and Sons, Reading, delivered a lecture illustrated with limelight views, on "Early Potato Cultivation," and Mr. R. K. Sillars presided over a good attendance of members. Mr. Lasham described the importance of using immature seed, as experiments have shown that the resulting crop is double that obtained from mature tubers. This applies to early, mid-season, and late or maincrop varieties, and explains the success of Scotch seed over that grown in the South of England. It would, therefore, be good policy to adopt the plan of lifting a certain number of rows every year—according to the quantity of seed required—before the Potatos were mature, in order to furnish immature seed for the following season. The various methods by which early Potatos may be produced, such as by cultivation in boxes, pots, frames and on a warm border, were fully explained. In addition a series of slides illustrative of the different methods of growing Potatos in the early districts for the English markets was shown, and the various modes of cultivation explained.

BROUGHTY FERRY HORTICULTURAL.—The ordinary monthly meeting was held under the presidency of Mr. James Bethel on October 21, when Mr. James Staward, St. Fort Gardens, Newport, lectured on "Growing Tree Carnations." The lecturer imparted much practical information as he related his experience in cultivation from the cutting to the perfect flower. A lengthy and lively discussion followed, when many questions were satisfactorily answered by Mr. Staward. The lecturer illustrated his lecture with admirable flowers of Tree Carnations, as well as neat little specimen plants in 2½-inch, 4-inch and 5-inch pots. The monthly prize was awarded to Mr. George Masson, Aystree Gardens, for a very fine specimen of Begonia Gloire de Lorraine.

WARGRAVE GARDENERS'.—A well-attended meeting of this society took place on Wednesday evening, October 22, when "ten-minute papers" were delivered by Mr. Baker on "The Propagation of Stove and Greenhouse Plants," Mr. Batchelor on "Tomato Culture," Mr. Irvin on "Large Flowering Cinerarias," and Mr. Gray on "Violet Culture." Each subject was treated in a practical manner, full cultural directions being given, and a capital discussion ensued after each paper. Three new members were elected. The Wargrave Plant Farm, Ltd., staged a splendid lot of outdoor Chrysanthemums, to which the judges awarded a cultural certificate. Mr. Pope showed a group of Begonia Gloire de Lorraine, Mr. Mackenzie a vase of Dahlias, and Mr. Stephens a vase of Carnations.

GARDENING APPOINTMENTS.

[*Correspondents are requested to* **write the names of persons and places as legibly as possible.** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

PUBLISHERS' NOTICES.

"THE TOWN BEAUTIFUL."

TOWN PLANTING,

and the Trees, Shrubs, Herbaceous and other Plants that are best adapted for resisting smoke.

By A. D. WEBSTER, Regent's Park, London.

With 16 Full Page Plates. Crown 8vo. 3/6.

This book is the outcome of an essay for which the Royal Scottish Arboricultural Society awarded their gold medal to the author, whose experience in London has afforded him exceptional opportunities of getting together a list of trees, etc., and of studying the conditions under which they may be most successfully cultivated.

GEORGE ROUTLEDGE & SONS, LTD.,

Broadway House, 68-74, Carter Lane, London, E.C.

Kelway
of Langport, Somerset

LOVELY DELPHINIUMS

Kelway's Delphiniums grow to a height of from four to eight or more feet and bear masses of fine shapely blooms in all shades of blue and purple. They thrive with a minimum of attention in almost any soil and situation, and they provide a bold and beautiful show either massed by themselves or as a part of the Kelway Colour Border.

KELWAY COLOUR BORDER (Regd.)

To secure absolute perfection in your Herbaceous Border, stock it with Kelway Hardy Perennials. Their bold forms and lovely colours represent the outcome of years of patient experiment and hybridization, while they are raised from such strong country-grown stocks that they may be depended upon to flourish under almost all conditions of climate.

NOW IS THE TIME TO PLANT.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

TENDERS.

ST. ANNES-ON-THE-SEA URBAN DISTRICT COUNCIL.

THE above COUNCIL are prepared to receive the names of Landscape Gardeners or other persons desirous of entering for the undermentioned competitions, from which a limited number will be selected, namely:—

1st. Laying out St. George's Gardens as ornamental Pleasure and Recreation Grounds, and the provision of a Pavilion and an open-air Bandstand, etc., therein.

2nd. Laying out of the Beach and Foreshore and providing for open-air sea-water baths and Marine Lake, etc.

Further particulars may be obtained on application to the undersigned.

Premiums of £50 and £25 are offered for each Competition, the selected Plans to become the sole property of the Council, but the acceptance of any Plan does not necessarily entail the carrying out of the work by the successful competitor.

The names of the intended Competitors must be sent to me not later than Saturday, the 22nd instant.

By order of the Council.

T. BRADLEY, Clerk.

Public Offices,
St. Annes-on-the-Sea.
November 8th, 1913

PUBLISHERS' NOTICES.

"THE TOWN BEAUTIFUL."

TOWN PLANTING,

and the Trees, Shrubs, Herbaceous and other Plants that are best adapted for resisting smoke.

By A. D. WEBSTER, Regent's Park, London.

With 16 Full Page Plates. Crown 8vo. 3/6.

This book is the outcome of an essay for which the Royal Scottish Arboricultural Society awarded their gold medal to the author, whose experience in London has afforded him exceptional opportunities of getting together a list of trees, etc., and of studying the conditions under which they may be most successfully cultivated.

HYBRID WINTER FLOWERING BEGONIAS

is cultivated in our Glasshouses.

☞ AWARDED SIX GOLD MEDALS. ☜

Superb New Varieties.

SCARLET BEAUTY, A.M., R.H.S., 1912 ..... each 10/6
Vivid Scarlet, Double and Semi-double, 2-2½ inches in diameter, in handsome sprays; remarkably free, vigorous grower. The attractive dark green foliage enhances the brilliance of the flowers. Superb for decorative use.

ECLIPSE, A.M., R.H.S., 1912 ..... each 10/6
Salmon-Scarlet, semi-double, 2½-3 inches in diameter. Gloriously beautiful free growing and free blooming, handsome glossy green foliage, quite distinct in colour.

SUNRISE ..... each 7/6
Bright Rosy Red, a full double Camellia-shaped flower, 2½-3 inches in diameter; free blooming and a vigorous grower, a decorative plant of the highest excellence.

ALTRINCHAM PINK, A.M., R.H.S. ..... each 7/6
Bright Pink double flowers of Camellia form, 3 inches across, in upright sprays, wonderfully free; handsome bronze green foliage.

DUCHESS OF WESTMINSTER ..... each 7/6
Clear soft pink, double, 3 inches across; a glorious flower, particularly fine under artificial light; free growing and free blooming. Superb.

CLIBRANS' PINK. A.M., R.H.S. ..... each 3/6
Bright Pink, double, 3 inches across, in long sprays carrying from eight to thirteen each. A good grower and a free bloomer. **One of the finest we have ever raised.**

DISPLAY ..... each 7/6
Rich Deep Salmon, an intense and lovely shade. The flowers, 2½ inches in diameter, of fine form, are freely produced in upright sprays, vigorous grower.

CHARMING ..... each 5/-
Clear Soft Pink a beautiful shade, perfectly double, 3 inches in diameter, in elegant sprays profuse in bloom and free in growth. Either by day or under artificial light it is equally effective.

CLIBRANS' PERFECTION ..... each 5/-
Brilliant Rosy Red, double, 3-3½ inches in diameter, in elegant sprays. All the points that make for excellence are present in this variety—the colour in particular is unique.

General Collection.

	Each
BANK HALL BEAUTY ..... **Salmon red semi-double, 2½-3 in. across,** long elegant sprays, handsome foliage; free, robust, **18**- per doz.	2/-
BEAUTY OF HALE ..... **Salmon, suffused rose, double, 2½-3 in. across,** in handsome arching sprays, foliage, **24**/- per doz.	2/6
BOWDON BEAUTY ..... **Bright rose pink, double, 2-2½ in. across,** with great freedom, ideal for decoration and cutting, **12**/- & **15**/- per doz.	1/3, 1/6
Elatior, A.M., R.H.S. ..... Rich rosy carmine, semi-double, with wonderful freedom, one of the most useful for decorative use, **18**/- per doz.	1/6
EMILY CLIBRAN ..... **Light salmon, flushed orange,** a beautiful double flower, 2½-3 in. across, unusually free; glossy dark bronze green foliage, **24**/- per doz.	2/6
Ensign, A.M., R.H.S. ..... Light carmine toned scarlet, semi-double, fine, a free grower and free bloomer, **12**/- & **15**/- per doz.	1/3, 1/6
Ideala, A.M., R.H.S. ..... Bright rosy carmine, 2 in. across, free; dwarf habit, **18**/- per doz.	1/6
Julius, A.M., R.H.S. ..... Delicate rose pink and white, 2-2½ in. diam., **12**/- & **15**/- per doz.	1/3, 1/6

MARKETS.

COVENT GARDEN, November 12.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—Business has not been especially brisk this last week, but there are no fresh subjects to record. The supplies of Roses are getting considerably less, and their prices are still on the up-grade, especially for choice varieties with long stems. The Carnation trade shows a little improvement generally. There are fine blooms of Enchantress, Scarlet Glow, White Perfection, Winsor, Carola, Rose-Pink Gloriosa, and Mayday. There is an abundant supply of Arums (Richardia) and Liliums; the prices are exceptionally low for November. Arums realise the better prices. Roman Hyacinths and Lily-of-the-Valley have increased in quantity, but it has been difficult to clear stocks of these. The trade in Camellias shows no improvement. Stephanotis is almost finished, and is all bought up very early each morning. The Chrysanthemum trade is no better; single varieties are most in demand. There is practically no business in the foreign flower market; all foreign blooms show the effect of the long journey, and many pads of single Violets have reached the market in an unsaleable condition. Parma Violets travel much better, and there is a better demand for these flowers, but colder weather would bring an improvement in the trade for these, and their prices would rise.

Pomegranates, per case	3 0-	10 6
Quinces, ½ bushel..	10 0	—

REMARKS.—The market is well supplied with home-grown cooking Apples, the bulk consisting of Bramley's Seedling, there being some fine samples of this sort. English Dessert Apples are scarcer. It is estimated that 30,430 barrels and cases of Apples and Pears are due from overseas, principally dessert varieties. Grapes of all varieties continue very plentiful. Nuts of all kinds, with the exception of Cobnuts and English Walnuts, are a good supply. Supplies of home-grown and Teneriffe Tomatos are well maintained. There is a full supply of Cucumbers. Fairly large quantities of Dwarf Beans are arriving from all sources. Field Mushrooms are over. Quinces have been very scarce, and realised as much as 10s. per half sieve. All ordinary vegetables are plentiful.—*Edgar H. Rides, Covent Garden, November 13, 1913.*

REMARKS.—Trade is fair. Consignments are quite equal to the demand and prices are about the same as those of the past few weeks. Disease is causing a little trouble in some varieties.—*Edward J. Newborn, Covent Garden and St. Pancras, November 11, 1913.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending November 12.

The Eighth Unseasonably Warm Week in Succession.—For nearly three weeks there has not occurred a single unseasonably cold day. During the same period the nights have proved very variable in temperature, but on no night did the exposed thermometer register more than 8° of frost. The ground is still 3° warmer at 2 feet deep, and 4° warmer at 1 foot deep, than is seasonable. Rain fell on each of the last five days, and to the total depth of nearly an inch. Three and a half gallons of rainwater has passed through the bare soil percolation gauge during the week, and two and a half gallons through that on which short grass is growing. The sun shone on an average for 3¼ hours a day, which is about 1½ hours a day in excess of the usual duration for this period in November. Light airs and calms prevailed until the last day of the week, when the wind proved of moderate strength. The mean amount of moisture in the air at three o'clock in the afternoon fell short of a seasonable quantity for that hour by 3 per cent. All the blooms on my Dahlias were killed by frost on the night of the 8th, but the plants themselves were only partially injured. *E. M., Berkhamsted, November 12, 1913.*

GARDENING APPOINTMENTS

Mr. H. Green, for the past 3½ years Foreman at Nostell Priory Gardens, Wakefield, Yorkshire, as Gardener to Major CROSBY, Claremont House, Grimsby.

Mr. William Ransom, for the past 2 years Foreman in the Gardens at Broadhanger, Petersfield, Hampshire, and previously at Easton Grey, Malmesbury, and Elmstone Court, near Dover, as Gardener to Mr. E. NORTON, Uplands, Fareham, Hampshire.

NOTICES.

CAUTION.

THE SECRET COMMISSIONS AND BRIBERY PREVENTION LEAGUE, INCORPORATED begs to call the attention of employers and gardeners to the fact that under the PREVENTION OF CORRUPTION ACT, 1906, any gardener who corruptly asks for, agrees to accept, or accepts, or any tradesman who offers, agrees to give, or gives, any secret commission or discount is liable to two years' imprisonment and, in addition, to a fine not exceeding £500.

The League has reason to believe that in many cases this Act is being disobeyed, and recommends employers carefully to note any changes made recently, or which may be made in future, in the placing of their orders, as the reason for such changes may be the refusal of Seedsmen and Nurserymen, who strictly observe the law, to give any presents to gardeners without the written authority of the employer.

Any information will be gladly afforded by the League. Address, 9, Queen Street Place, London, E.C.

EXHIBITIONS.

PERPETUAL FLOWERING CARNATION SOCIETY.

The 15TH EXHIBITION will be held at the ROYAL HORTICULTURAL HALL, WESTMINSTER,

on WEDNESDAY, DECEMBER 3, 1913.

Open 12 noon to 5 p.m. Admission **1/-.**

Schedules and other particulars from the Hon. Secretary—T. A. WESTON, Floradale, Orpington.

TENDERS.

ST. ANNES-ON-THE-SEA URBAN DISTRICT COUNCIL.

THE above COUNCIL are prepared to receive the names of Landscape Gardeners or other persons desirous of entering for the undermentioned competitions, from which a limited number will be selected, namely:—

1st. Laying out St. George's Gardens as ornamental Pleasure and Recreation Grounds, and the provision of a Pavilion and an open-air Band-stand, etc., therein.

2nd. Laying out of the Beach and Foreshore and providing for open-air sea-water baths and Marine Lake, etc.

Further particulars may be obtained on application to the undersigned.

Premiums of £50 and £25 are offered for each Competition, the selected Plans to become the sole property of the Council, but the acceptance of any Plan does not necessarily entail the carrying out of the work by the successful competitor.

The names of the intended Competitors must be sent to me not later than Saturday, the 22nd instant.

By order of the Council.

T. BRADLEY, Clerk.

Public Offices,
St. Annes-on-the-Sea,
November 8th, 1913.

TO SECRETARIES OF HORTICULTURAL SOCIETIES, ETC.

BEES, LTD., have prepared a LANTERN LECTURE, entitled "PLANT COLLECTING IN THE LAND OF THE BLUE POPPY." It is an interesting account of the travels of Mr. F. K. Ward while collecting New Plants in China. The lecture is printed, and there are about 50 lantern slides. Bees Ltd. will be pleased to loan the slides, and send copies of the lecture free of charge to any society which may have convenient vacant dates. Applications should be made at once, mentioning, whenever possible, two or more alternative dates.

FRUIT TREES & ROSES

CATALOGUE & CULTURAL HINTS GRATIS

Roses that WILL be Successful.

When making up the list of Roses for your Garden, give a thought to whether they will be successful or otherwise. Not all Roses are suitable for growth anywhere—some require too much care and attention, while others will only thrive in the protected area of the glasshouse.

Before making up your list, send to D. & W. Croll, the famous Scotch Specialists in the production of Roses, and they will advise you on the varieties best suited for growth in your garden.

Send to-day for their Catalogue and "Hints on the Cultivation of Roses." When ordering, enclose particulars, so that your plants can be selected as carefully as if you were present.

HYBRID WINTER FLOWERING BEGONIAS
is cultivated in our Glasshouses.

AWARDED SIX GOLD MEDALS.

Superb New Varieties.

SCARLET BEAUTY, A.M., R.H.S., 1912 ..... each 10/6
Vivid Scarlet, Double and Semi-double, 2-2½ inches in diameter, in handsome sprays; remarkably free, vigorous grower. The attractive dark green foliage enhances the brilliance of the flowers. Superb for decorative use.

ECLIPSE, A.M., R.H.S., 1912 ..... each 10/6
Salmon-Scarlet, semi-double, 2½-3 inches in diameter. Gloriously beautiful free growing and free blooming, handsome glossy green foliage, quite distinct in colour.

SUNRISE ..... each 7/6
Bright Rosy Red, a full double Camellia-shaped flower, 2½-3 inches in diameter; free blooming and a vigorous grower, a decorative plant of the highest excellence.

ALTRINCHAM PINK, A.M., R.H.S. ..... each 7/6
Bright Pink double flowers of Camellia form, 3 inches across, in upright sprays, wonderfully free; handsome bronze green foliage.

DUCHESS OF WESTMINSTER ..... each 7/6
Clear soft pink, double, 3 inches across; a glorious flower, particularly fine under artificial light; free growing and free blooming. Superb.

CLIBRANS' PINK, A.M., R.H.S. ..... each 3/6
Bright Pink, double, 3 inches across, in long sprays carrying from eight to thirteen each. A good grower and a free bloomer. **One of the finest we have ever raised.**

DISPLAY ..... each 7/6
Rich Deep Salmon, an intense and lovely shade. The flowers, 2½ inches in diameter, of fine form, are freely produced in upright sprays, vigorous grower.

CHARMING ..... each 5/-
Clear Soft Pink, a beautiful shade, perfectly double, 3 inches in diameter, in elegant sprays, profuse in bloom and free in growth. Either by day or under artificial light it is equally effective.

CLIBRANS' PERFECTION ..... each 5/-
Brilliant Rosy Red, double, 3-3½ inches in diameter, in elegant sprays. All the points that make for excellence are present in this variety—the colour in particular is unique.

General Collection.

BANK HALL BEAUTY ..... Each 2/-
Salmon red, semi-double, 2½-3 in. across, long elegant sprays, handsome foliage; free, robust, **18/-** per doz.

BEAUTY OF HALE 2/6
Salmon, suffused rose, double, 2½-3 in. across, in handsome arching sprays, foliage, **24/-** per doz.

BOWDON BEAUTY 1/3, 1/6
Bright rose pink, double, 2-2½ in. across, with great freedom, ideal for decoration and cutting, **12/- & 15/-** per doz.

Elatior, A.M., R.H.S. 1/6
Rich rosy carmine, semi-double, with wonderful freedom, one of the most useful for decorative use, **18/-** per doz.

EMILY CLIBRAN 2/6
Light salmon, flushed orange, a beautiful double flower, 2½-3 in. across, unusually free; glossy dark bronze green foliage, **24/-** per doz.

Ensign, A.M., R.H.S. 1/3, 1/6
Light carmine toned scarlet, semi-double, fine, a free grower and free bloomer, **12/- & 15/-** per doz.

Ideala, A.M., R.H.S. 1/6
Bright rosy carmine, 2 in. across, free; dwarf habit, **18/-** per doz.

Julius, A.M., R.H.S. ..... Each 1/3, 1/6
Delicate rose pink and white, 2-2½ in. diam., **12/- & 15/-** per doz.

LADY COOPER 5/-
Clear warm salmon pink, 3-3½ in. diam., a lovely shade, beautiful under artificial or natural light, **54/-** per doz.

MISS CLIBRAN, A.M., R.H.S. 5/-
Rich blush pink, double, 3 in. in diam., distinct and handsome: grand, **54/-** per doz.

Mrs. Heal, A.M., R.H.S. 1/3, 1/6
Brilliant rose-carmine, toned scarlet, 3 in. across, free, **12/- & 15/-** per doz.

Mr. T. H. Cook 5/-
Rose pink, a rich and lovely shade, double Camellia form, 3-3½ in. across, strong, robust, free, **54/-** per doz.

PROGRESS 5/-
Outer petals salmon pink, inner petals orange, double, 2 in. across, in upright sprays; a distinct departure in colour, **54/-** per doz.

THE GEM, A.M., R.H.S. 5/-
Brilliant rosy scarlet, in such abundance as to almost cover the plant; compact habit.

All in 5 inch pots, in bud. Good bushy plants. In bud and bloom.

Send your Order to-day. Immediate or deferred delivery.

THE SYCAMORE WORKS CO.,

Hothouse Builders and Heating Engineers, WIMBLEDON.

EST. 1870.

IMPORTANT

Before placing orders for Hothouse work, write for our representative to call and take particulars of your requirements. We will then post you plans, specifications, and estimates, for which we make no charge whatever, business resulting or not. We build good, sound greenhouses which last, all work undertaken by us being carried out by highly skilled workmen on TIME rates only, and NOT by the unsatisfactory piece-work system.

BIRMINGHAM

CHRYSANTHEMUM SHOW FOR 1914,

WILL BE HELD AT

BINGLEY HALL,

10th, 11th, and 12th November.

ALFRED NOAKES, Secretary,

148, BRISTOL STREET, BIRMINGHAM.

NOTICES.

CAUTION.

THE SECRET COMMISSIONS AND BRIBERY PREVENTION LEAGUE, INCORPORATED begs to call the attention of employers and gardeners to the fact that under the PREVENTION OF CORRUPTION ACT, 1906, any gardener who corruptly asks for, agrees to accept, or accepts, or any tradesman who offers, agrees to give, or gives, any secret commission or discount is liable to two years' imprisonment and, in addition, to a fine not exceeding £500.

The League has reason to believe that in many cases this Act is being disobeyed, and recommends employers carefully to note any changes made recently, or which may be made in future, in the placing of their orders, as the reason for such changes may be the refusal of Seedsmen and Nurserymen, who strictly observe the law, to give any presents to gardeners without the written authority of the employer.

Any information will be gladly afforded by the League. Address, 9, Queen Street Place, London, E.C.

ROYAL GARDENERS' ORPHAN FUND.

NOTICE IS HEREBY GIVEN that an ELECTION of CANDIDATES to receive the benefits of this Fund will take place at "Simpson's," 100, Strand, London, W.C., on Friday, February 6th, 1914. Nomination forms, to be obtained from the Secretary, must be delivered to him not later than Tuesday, December 16th next, on which date the list will be closed.

By order,

B. WYNNE, Secretary.

19, Bedford Chambers, Covent Garden, London, W.C.

TO SECRETARIES OF HORTICULTURAL SOCIETIES, ETC.

BEES, LTD., have prepared a LANTERN LECTURE, entitled "PLANT COLLECTING IN THE LAND OF THE BLUE POPPY." It is an interesting account of the travels of Mr. F. K. Ward while collecting New Plants in China. The lecture is printed, and there are about 50 lantern slides. Bees Ltd. will be pleased to loan the slides, and send copies of the lecture free of charge to any society which may have convenient vacant dates. Applications should be made at once, mentioning, whenever possible, two or more alternative dates.

BEES LTD., MILL STREET, LIVERPOOL.

HYBRID WINTER FLOWERING BEGONIAS

is cultivated in our Glasshouses.

☞ AWARDED SIX GOLD MEDALS. ☜

Superb New Varieties.

SCARLET BEAUTY, A.M., R.H.S., 1912 ..... each 10/6
Vivid Scarlet, Double and Semi-double, 2-2½ inches in diameter, in handsome sprays; remarkably free, vigorous grower. The attractive dark green foliage enhances the brilliance of the flowers. Superb for decorative use.

ECLIPSE, A.M., R.H.S., 1912 ..... each 10/6
Salmon-Scarlet, semi-double, 2½-3 inches in diameter. Gloriously beautiful free growing and free blooming, handsome glossy green foliage, quite distinct in colour.

SUNRISE ..... each 7/6
Bright Rosy Red, a full double Camellia-shaped flower, 2½-3 inches in diameter; free blooming and a vigorous grower, a decorative plant of the highest excellence.

ALTRINCHAM PINK, A.M., R.H.S. ..... each 7/6
Bright Pink double flowers of Camellia form, 3 inches across, in upright sprays, wonderfully free; handsome bronze green foliage.

DUCHESS OF WESTMINSTER ..... each 7/6
Clear soft pink, double, 3 inches across; a glorious flower, particularly fine under artificial light; free growing and free blooming. Superb.

CLIBRANS' PINK, A.M., R.H.S. ..... each 3/6
Bright Pink, double, 3 inches across, in long sprays carrying from eight to thirteen each. A good grower and a free bloomer. **One of the finest we have ever raised.**

DISPLAY ..... each 7/6
Rich Deep Salmon, an intense and lovely shade. The flowers, 2½ inches in diameter, of fine form, are freely produced in upright sprays, vigorous grower.

CHARMING ..... each 5/-
Clear Soft Pink, a beautiful shade, perfectly double, 3 inches in diameter, in elegant sprays, profuse in bloom and free in growth. Either by day or under artificial light it is equally effective.

CLIBRANS' PERFECTION ..... each 5/-
Brilliant Rosy Red, double, 3-3½ inches in diameter, in elegant sprays. All the points that make for excellence are present in this variety—the colour in particular is unique.

General Collection.

	Each
BANK HALL BEAUTY ..... **Salmon red, semi-double, 2½-3 in. across,** long elegant sprays, handsome foliage; free, robust, **18/-** per doz.	2/-
BEAUTY OF HALE ..... **Salmon, suffused rose, double, 2½-3 in. across,** in handsome arching sprays, foliage, **24/-** per doz.	2/6
BOWDON BEAUTY ..... **Bright rose pink, double, 2-2½ in. across,** with great freedom, ideal for decoration and cutting, **12/- & 15/-** per doz.	1/3, 1/6
Elatior, A.M., R.H.S. ..... Rich rosy carmine, semi-double, with wonderful freedom, one of the most useful for decorative use, **18/-** per doz.	1/6
EMILY CLIBRAN ..... **Light salmon, flushed orange,** a beautiful double flower, 2½-3 in. across, unusually free; glossy dark bronze green foliage, **24/-** per doz.	2/6
Ensign, A.M., R.H.S. ..... Light carmine, toned scarlet, semi-double, fine, a free grower and free bloomer, **12/- & 15/-** per doz.	1/3, 1/6
Ideala, A.M., R.H.S. ..... Bright rosy carmine, 2 in. across, **free; dwarf** habit, **18/-** per doz.	1/6
Julius, A.M., R.H.S. ..... Delicate rose pink and white, 2-2½ in. diam., **12/- & 15/-** per doz.	1/3, 1/6
MISS CLIBRAN, A.M., R.H.S. **Rich blush pink, double, 3 in. in diam.,** distinct and handsome: grand, **54/-** per doz.	5/-
Mrs. Heal, A.M., R.H.S. ..... Brilliant rose carmine, toned scarlet, 3 in. across, free, **12/- & 15/-** per doz.	1/3, 1/6
Mr. T. H. Cook ..... Rose pink, a rich and lovely shade, double Camellia form, 3-3½ in. across, strong, robust, free, **54/-** per doz.	5/-
PROGRESS ..... Outer petals salmon pink, inner petals orange, double, 2 in. across, in upright sprays; a distinct departure in colour, **54/-** per doz.	5/-
THE GEM, A.M., R.H.S. ..... **Brilliant rosy scarlet,** in such abundance as to almost cover the plant; compact habit.	5/-

All in 5 inch pots, in bud. Good bushy plants. In bud and bloom.

Send your Order to-day. Immediate or deferred delivery.

XL ALL! XL ALL! XL ALL!

RICHARDS' FUMIGATOR.

AUTUMN IS WITH US!

And Gardeners will be on the alert for Frost.

Plants which have been taken under glass, from the open, would be all the better for a vaporising with **XL ALL Compound,** or a syringing with **XL ALL Liquid Nicotine Insecticide Wash,** whichever method is most suitable and convenient. Mealy Bug and Scale on Vines and Fruit Trees can be speedily stamped out with one or two dressings of **Liquid Nicotine Insecticide.**

Hundreds of gardeners can confirm this statement. **XL ALL** is the best, most largely used, and popular Insecticide of the day.

Will gardeners kindly remember that although these preparations are what are known as poisonous, they can be ordered through any Nurseryman, Seedsman or Florist? Get in supplies with your Bulbs and Seeds! Most gardeners will know that **XL ALL Insecticide** is much more efficacious than the common soapy (non-poisonous) washes now so much advertised.

Prices, particulars, and supplies from Nurserymen, Seedsmen and Florists everywhere.

G. H. RICHARDS (XL ALL),

Largest Manufacturer of Nicotine and other Insecticides in the World,

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

POLICE RECRUITS are required for the Shanghai Municipal Police.

Applicants must be unmarried, of good physique, with sound teeth, about 22 to 26 years of age, about 5ft. 10in. in height, chest about 38 in. fully expanded, and able to furnish excellent references as to character.

Salary commences at Taels 70 per month, equal to about £9; the value of the Tael at present rate of exchange is about 2s. 8d., but it is liable to fluctuation. Men in the Army and Navy, or Reserve, must obtain their full discharge before enlistment.

Liberal superannuation scheme and good prospects of promotion.

Particulars will not be forwarded to applicants unless they clearly state that they are able to comply with the above requirements.—Apply by letter in envelope marked "Police," to Messrs. JOHN POOK & CO., agents for the Municipal Council of Shanghai, 68, Fenchurch Street, London, E.C. November, 1913.

THE POPULARITY of "XL ALL" Specialities increases every year. All gardeners proclaim that nothing equals these celebrated preparations. "XL ALL" NICOTINE VAPOURISING COMPOUND, the Gardener's favourite Fumigant both Liquid and Cake. "XL ALL" NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used. "XL ALL" INSECTICIDE WASH B (*sine* Nicotine), best non-poisonous wash on the market. Other preparations of great renown are:—"XL ALL" CAUSTIC WINTER WASH for dormant Fruit Trees and Bushes; Richards' WORM KILLER for Lawns, both non-poisonous. Don't forget to ask your Nurseryman or Seedsman for my small pink list.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

KELWAY COLOUR BORDERS are now being planned and planted. Write your requirements to Langport and Borders of any kind can be arranged for immediate delivery at all prices. State area, etc.
———, Esq., Jamaica Street, Glasgow:—"I have to thank you for the plants I received from you in the Spring. Everything, without exception, has done splendidly, and my border at the present time is simply grand."
Kelway's Manual of Horticulture, 2s. 6d.; Gardens of Delight, 6d.; returnable to customers.
KELWAY & SON, The Royal Horticulturists, Langport, Somerset.

"NIQUAS."—The great and unparalleled success of this IMPROVED NON-POISONOUS INSECTICIDE should secure its universal use by all Gardeners. It is a concentrated Vegetable Extract, adaptable for all Trees and Plants, and when used with the special syringe it is most economical, with certain death to all insect life. Ask your Seedsman for full particulars.
Manufacturers: CORRY & CO., Ltd., London.
Granted large Silver Gilt Medal and Diploma of Honour at the International Exhibition, 1912.
Established 1848.

BARR'S HYACINTHS, TULIPS, Daffodils, Irises, Lilies, &c., for pots and bedding. Finest quality. Moderate prices. Descriptive Catalogue free.—BARR & SONS, 11, 12, and 13, King Street, Covent Garden, London.

CAUTION.

THE SECRET COMMISSIONS AND BRIBERY PREVENTION LEAGUE, INCORPORATED, begs to call the attention of employers and gardeners to the fact that under the PREVENTION OF CORRUPTION ACT, 1906, any gardener who corruptly asks for, agrees to accept, or accepts, or any tradesman who offers, agrees to give, or gives any secret commission or discount is liable to two years' imprisonment and, in addition, to a fine not exceeding £500.

The League has reason to believe that in many cases this Act is being disobeyed, and recommends employers carefully to note any changes made recently, or which may be made in future, in the placing of their orders, as the reason for such changes may be the refusal of Seedsmen and Nurserymen who strictly observe the law to give any presents to gardeners without the written authority of the employer.

Any information will be gladly afforded by the League. Address, 9, Queen Street Place, London, E.C.

PUBLISHERS' NOTICES.

CURTIS'S BOTANICAL MAGAZINE

Coloured figures so arranged as to show details of the plants and structural dissections, and descriptions, structural and historical, of new and rare flowering plants from the Royal Botanic Gardens, Kew, and other botanical establishments, suitable for the Garden, Stove, or Conservatory. The "Botanical Magazine," commenced in 1787, and continued with uninterrupted regularity to the present time, forms the most extensive and authentic repertory of Plant History and Portraiture extant.

Why Scotch-grown Roses are Better.

HIGH on the upland, fed by the bracing winds of the North Sea, are the Nurseries of D. & W. Croll. For many years these famous Nurserymen have been engaged in rearing roses—roses that are sturdy as their native air—cared for and tended by expert gardeners whose experience is based on the Scottish trend for gardening, known and appreciated the wide-world o'er.

D. & W. Croll's latest rose products are acknowledged to be the finest reared by this famous firm. The roses are sturdy, healthy and vigorous, they transplant with no risk whatever, and will withstand the onslaughts of the most severe winter.

HYBRID WINTER FLOWERING BEGONIAS

is cultivated in our Glasshouses.

AWARDED SIX GOLD MEDALS.

Superb New Varieties.

SCARLET BEAUTY, A.M., R.H.S., 1912 ..... each 10/6
Vivid Scarlet, Double and Semi-double, 2-2½ inches in diameter, in handsome sprays; remarkably free, vigorous grower. The attractive dark green foliage enhances the brilliance of the flowers. Superb for decorative use.

ECLIPSE, A.M., R.H.S., 1912 ..... each 10/6
Salmon-Scarlet, semi-double, 2½-3 inches in diameter. Gloriously beautiful free growing and free blooming, handsome glossy green foliage, quite distinct in colour.

SUNRISE ..... each 7/6
Bright Rosy Red, a full double Camellia-shaped flower, 2½-3 inches in diameter; free blooming and a vigorous grower, a decorative plant of the highest excellence.

ALTRINCHAM PINK, A.M., R.H.S. ..... each 7/6
Bright Pink double flowers of Camellia form, 3 inches across, in upright sprays, wonderfully free; handsome bronze green foliage.

DUCHESS OF WESTMINSTER ..... each 7/6
Clear soft pink, double, 3 inches across; a glorious flower, particularly fine under artificial light; free growing and free blooming. Superb.

CLIBRANS' PINK, A.M., R.H.S. ..... each 3/6
Bright Pink, double, 3 inches across, in long sprays carrying from eight to thirteen each. A good grower and a free bloomer. **One of the finest we have ever raised.**

DISPLAY ..... each 7/6
Rich Deep Salmon, an intense and lovely shade. The flowers, 2½ inches in diameter, of fine form, are freely produced in upright sprays, vigorous grower.

CHARMING ..... each 5/-
Clear Soft Pink, a beautiful shade, perfectly double, 3 inches in diameter, in elegant sprays, profuse in bloom and free in growth. Either by day or under artificial light it is equally effective.

CLIBRANS' PERFECTION ..... each 5/-
Brilliant Rosy Red, double, 3-3½ inches in diameter, in elegant sprays. All the points that make for excellence are present in this variety—the colour in particular is unique.

General Collection.

	Each
BANK HALL BEAUTY ..... **Salmon red, semi-double, 2½-3 in. across,** long elegant sprays, handsome foliage; free, robust, **18/-** per doz.	2/-
BEAUTY OF HALE ..... **Salmon, suffused rose, double, 2½-3 in. across,** in handsome arching sprays, foliage, **24/-** per doz.	2/6
BOWDON BEAUTY ..... **Bright rose pink, double, 2-2½ in. across,** with great freedom, ideal for decoration and cutting, **12/- & 15/-** per doz.	1/3, 1/6
Elatior, A.M., R.H.S. ..... Rich rosy carmine, semi-double, with wonderful freedom, one of the most useful for decorative use, **18/-** per doz.	1/6
EMILY CLIBRAN ..... **Light salmon, flushed orange,** a beautiful double flower, 2½-3 in. across, unusually free; glossy dark bronze green foliage, **24/-** per doz.	2/6
Ensign, A.M., R.H.S. ..... Light carmine, toned scarlet, semi-double, fine, a free grower and free bloomer, **12/- & 15/-** per doz.	1/3, 1/6
Ideala, A.M., R.H.S. ..... Bright rosy carmine, 2 in. across, free; dwarf habit, **18/-** per doz.	1/6
Julius, A.M., R.H.S. ..... Delicate rose pink and white, 2-2½ in. diam., **12/- & 15/-** per doz.	1/3, 1/6
MISS CLIBRAN, A.M., R.H.S. **Rich blush pink, double, 3 in. in diam.,** distinct and handsome: grand, **54/-** per doz.	5/-
Mrs. Heal, A.M., R.H.S. ..... Brilliant rose carmine, toned scarlet, 3 in. across, free, **12/- & 15/-** per doz.	1/3, 1/6
Mr. T. H. Cook ..... Rose pink, a rich and lovely shade, double Camellia form, 3-3½ in. across, strong, robust, free, **54/-** per doz.	5/-
PROGRESS ..... Outer petals salmon pink, inner petals orange, double, 2 in. across, in upright sprays; a distinct departure in colour, **54/-** per doz.	5/-
THE GEM, A.M., R.H.S. ..... **Brilliant rosy scarlet,** in such abundance as to almost cover the plant; compact habit.	5/-

All in 5 inch pots, in bud. Good bushy plants. In bud and bloom.

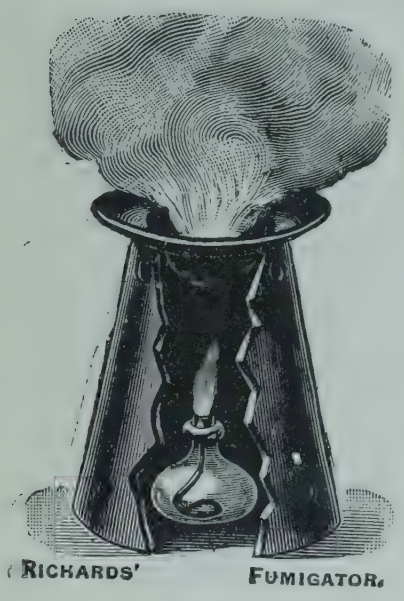
FUMIGATING COMPOUND

Vaporising Perfected.

XL ALL! XL ALL! XL ALL!



RICHARDS' FUMIGATOR.

AUTUMN IS WITH US!

And Gardeners will be on the alert for Frost.

Plants which have been taken under glass, from the open, would be all the better for a vaporising with **XL ALL Compound,** or a syringing with **XL ALL Liquid Nicotine Insecticide Wash,** whichever method is most suitable and convenient. Mealy Bug and Scale on Vines and Fruit Trees can be speedily stamped out with one or two dressings of **Liquid Nicotine Insecticide.**

Hundreds of gardeners can confirm this statement. **XL ALL** is the best, most largely used, and popular Insecticide of the day.

Will gardeners kindly remember that although these preparations are what are known as poisonous, they can be ordered through any Nurseryman, Seedsman or Florist? Get in supplies with your Bulbs and Seeds! Most gardeners will know that **XL ALL Insecticide** is much more efficacious than the common soapy (non-poisonous) washes now so much advertised.

Prices, particulars, and supplies from Nurserymen, Seedsmen and Florists everywhere.

G. H. RICHARDS (XL ALL),

Largest Manufacturer of Nicotine and other Insecticides in the World,

Copies of the prospectus, together with forms of application and press opinions, can be obtained at the offices of the Company, and at the Company's Bankers, Solicitors and Brokers.

MARKETS.

COVENT GARDEN, December 3.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

— Sunrise ..	2 6-	3 6
Spiræa, per doz. bunches ..	6 0-	8 0
Stephanotis, per spray of 72 ..	3 0-	3 6
Tuberoses, per gross	4 0-	5 0
Violets, English, per dozen bunches	1 0-	1 6
— Princess of Wales per doz. bunches	2 0-	3 0

REMARKS.—The large supplies of cut flowers continued throughout November, and the prices remained very low. The glut of Chrysanthemums has never continued so long as it has done this season. Although there are large quantities of Chrysanthemums, the prices for these flowers are hardening, especially for white blooms in bunches. The leading varieties are White Thompson, Pankucke and Heston White. The coloured varieties are Winter Cheer, Wilcox Bronze, Tuxedo Phœbus, David Ingamels and Balfour. Arums (Richardias) and Liliums are arriving in quantity. There is still a plentiful supply of Carnations, and prices are much firmer for white and scarlet varieties. Lily-of-the-Valley continues to sell for good prices. Camellias and Roman Hyacinths sell very slowly. Daffodils are already in the market, but there is no great demand for them.

Pineapples, St. Michael ..	3 0-	3 6
Pomegranates, per case	3 0-	10 6

REMARKS.—Both English and imported Apples are showing a shortage in supplies, and consequently their prices have advanced. The following varieties of Pears are available: Doyenné du Comice, Glou Morçeau, Winter Nelis, Kieffers from America, in barrels, and Catillac from France and Holland. The consignments of English and Belgian Grapes have increased during the past week, and Muscats are now gradually shortening in supply. Nuts of all kinds are dearer than usual at this season of the year; this also applies to Metz Fruits and Muscatels. The supplies of English Tomatos are now declining. Tomatos from the Canary Islands will now be available in much larger quantities. Forced vegetables obtainable include Seakale, Asparagus, Peas, Beans, Potatos, Radishes, Cucumbers and Lettuce (Cos and Cabbage), Mushrooms, Dutch and Belgian Chicory and Stachys Tuberosa. The following tropical fruits are obtainable: Custard Apples, Grenadillas, Persimmons, Red Bananas, and Pines from the Azores. Consignments of Oranges are increasing, but those of Lemons are limited. All outdoor vegetables are very plentiful owing to the mild weather.—*Edgar H. Rides, Covent Garden, December* 3, 1913.

Potatos.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending December 3, 1913.

The Eleventh Unseasonably Warm Week in Succession.—This was another warm week, and the eleventh warm week in succession, and had in it the three most unseasonably warm days of the whole of November, the highest readings in the thermometer screen being respectively 56°, 57°, and 55°, which is 11°, 12°, and 10° warmer than the average for the same time of year. On the warmest night the exposed thermometer never fell below 45°. This also is an unusually high reading for the end of November. The ground is at the present time 4° warmer at 2 feet deep, and 5° warmer at 1 foot deep than is seasonable. Rain fell on three days, but to the total depth of only one-tenth of an inch. The percolation of rainwater through both the soil gauges is now very slight. The sun shone on an average for 1¾ hours a day, which is a quarter of an hour a day longer than is usual at the same period of the year. On the sunniest day (Nov. 29) the sun shone brightly for 6½ hours—a remarkably good record for so late in November. The winds were, as a rule, rather high in the early part of the week, but since then light airs and calms have mostly prevailed. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 2 per cent.

NOVEMBER.

Remarkably Warm and Sunny and Rather Wet.—This was the warmest November of which I have here any record—that is to say, during the last 28 years. There was only one day in the month when the highest reading in the thermometer screen was below the average temperature, and on three consecutive days at the end of the month 56°, 57°, and 55° were respectively recorded. The nights were also as a rule unusually warm, but were not as unseasonably warm as the days. On the warmest day the temperature in the thermometer screen rose to 59°, and on the coldest night the exposed thermometer registered 12° of frost. Both of these extreme readings are high for the month. Rain fell on 17 days, to the total depth of 3 inches, which is about ½ inch in excess of the November average. No snow fell during the month. The sun shone on an average for 2 hours 50 minutes a day, which is 1 hour 1 minute a day longer than the mean duration for November. This proved with one exception (1896) the sunniest November yet recorded here—that is to say, since 1886. There were only six sunless day—the average number being eleven. The wind, taking the month as a whole, was of moderate strength, and in the windiest hour the mean velocity only amounted to 15 miles. For only three hours during the month was the direction of the wind any point between north and east.

THE AUTUMN.

Singularly Warm, Rather Dry, and Very Sunny.—Altogether unlike the autumn of 1912, this proved, with one exception, the warmest autumn I have yet recorded here—that is to say, during the last 28 years. September was rather warm, and October and November remarkably warm. The total rainfall, taking the three months as a whole, was rather below the average. September proved very dry, while October and November, on the contrary, were both rather wet months. The sun shone on an average for 3 hours 35 minutes a day, which is 21 minutes a day longer than the mean duration for the season. September was rather dull, whereas October and November were both unusually sunny months for the time of year.

OUR UNDERGROUND WATER SUPPLY.

Since the winter half of the drainage year began in October, the total rainfall has exceeded the average for the previous 57 years by ¾ inch, which is equivalent to an excess of 17,640 gallons on each acre in this district. At the same time last year there was a deficiency amounting to 17,870 gallons per acre.—*E. M., Berkhamsted, December 3, 1913.*

KILPEST

For Your Garden's Sake

Use "KILPEST" and give your plants every opportunity to thrive. "KILPEST" exterminates black and green fly, red spider, thrip, gooseberry caterpillar, mildew and aphis pests, etc., on plants, flowers, or foliage. It cannot harm anything but insect life, and the most delicate plant cannot be injured by its use—it is absolutely non-poisonous. As a winter dressing "KILPEST" is invaluable for vines, peach and fruit trees of all kinds. Get a supply from your dealer to-day.

Prices: Pint 1/6; Quart 2/9; Half-gallon 5/-; Gallon 8/-.

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

POLICE RECRUITS are required for the Shanghai Municipal Police.

Applicants must be unmarried, of good physique, with sound teeth, about 22 to 26 years of age, about 5ft. 10in. in height, chest about 38in. fully expanded, and able to furnish excellent references as to character.

Salary commences at Taels 70 per month, equal to about £9; the value of the Tael at present rate of exchange is about 2s. 8d., but it is liable to fluctuation. Men in the Army and Navy, or Reserve, must obtain their full discharge before enlistment.

Liberal superannuation scheme and good prospects of promotion.

Particulars will not be forwarded to applicants unless they clearly state that they are able to comply with the above requirements.—Apply by letter in envelope marked "Police," to Messrs. JOHN POOK & CO., agents for the Municipal Council of Shanghai, 68, Fenchurch Street, London, E.C. November, 1913.

KENT EDUCATION COMMITTEE.—COUNTY AGRICULTURAL ORGANISER.—Applications are invited for the post of County Agricultural Organiser. The officer appointed will be an officer of the Kent Education Committee for (1) the co-ordination and supervision of all descriptions of Agricultural and Horticultural work in the County; (2) the organisation of field experiments, and special courses of instruction; and (3) the giving of advice as to the establishment of permanent Centres for Agricultural Instruction, etc Salary £300 to £450 according to age, qualifications and experience. Applications, accompanied by not more than three recent testimonials, should be sent to the undersigned so as to reach him not later than Monday, the 15th December. Canvassing, either directly or indirectly, will be considered a disqualification.—By order of the Committee, FRAS. W. CROOK, Secretary, Sessions House, Maidstone, 26th November, 1913.

THE POPULARITY of "XL ALL" Specialities increases every year. All gardeners proclaim that nothing equals these celebrated preparations. "XL ALL" NICOTINE VAPOURISING COMPOUND, the Gardener's favourite Fumigant both Liquid and Cake. "XL ALL" NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used. "XL ALL" INSECTICIDE WASH B (*sine* Nicotine), best non-poisonous wash on the market. Other preparations of great renown are:—"XL ALL" CAUSTIC WINTER WASH for dormant Fruit Trees and Bushes; Richards' WORM KILLER for Lawns, both non-poisonous. Don't forget to ask your Nurseryman or Seedsman for my small pink list.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

90,000 JAPANESE LILIES, 75,000 Hardy Ferns, 25 Acres of Hardy Perennials. Illustrated and Descriptive Catalogues free on application.—PERRY'S HARDY PLANT FARM, Enfield.

"NIQUAS."—The great and unparalleled success of this IMPROVED NON-POISONOUS INSECTICIDE should secure its universal use by all Gardeners. It is a concentrated Vegetable Extract, adaptable for all Trees and Plants, and when used with the special syringe it is most economical, with certain death to all insect life. Ask your Seedsman for full particulars.

CAUTION.

THE SECRET COMMISSIONS AND BRIBERY PREVENTION LEAGUE, INCORPORATED, begs to call the attention of employers and gardeners to the fact that under the PREVENTION OF CORRUPTION ACT, 1906, any gardener who corruptly asks for, agrees to accept, or accepts, or any tradesman who offers, agrees to give, or gives any secret commission or discount is liable to two years' imprisonment and, in addition, to a fine not exceeding £500.

The League has reason to believe that in many cases this Act is being disobeyed, and recommends employers carefully to note any changes made recently, or which may be made in future, in the placing of their orders, as the reason for such changes may be the refusal of Seedsmen and Nurserymen who strictly observe the law to give any presents to gardeners without the written authority of the employer.

Any information will be gladly afforded by the League. Address, 9, Queen Street Place, London, E.C.

PUBLISHERS' NOTICES.

XL ALL! XL ALL! XL ALL!

RICHARDS' FUMIGATOR.

AUTUMN IS WITH US!

And Gardeners will be on the alert for Frost.

Plants which have been taken under glass, from the open, would be all the better for a vaporising with **XL ALL Compound,** or a syringing with **XL ALL Liquid Nicotine Insecticide Wash,** whichever method is most suitable and convenient. Mealy Bug and Scale on Vines and Fruit Trees can be speedily stamped out with one or two dressings of **Liquid Nicotine Insecticide.**

Hundreds of gardeners can confirm this statement. **XL ALL** is the best, most largely used, and popular Insecticide of the day.

Will gardeners kindly remember that although these preparations are what are known as poisonous, they can be ordered through any Nurseryman, Seedsman or Florist? Get in supplies with your Bulbs and Seeds! Most gardeners will know that **XL ALL Insecticide** is much more efficacious than the common soapy (non-poisonous) washes now so much advertised.

Prices, particulars, and supplies from Nurserymen, Seedsmen and Florists everywhere.

NOTICES.

CAUTION.

THE SECRET COMMISSIONS AND BRIBERY PREVENTION LEAGUE, INCORPORATED, begs to call the attention of employers and gardeners to the fact that under the PREVENTION OF CORRUPTION ACT, 1906, any gardener who corruptly asks for, agrees to accept, or accepts, or any tradesman who offers, agrees to give, or gives any secret commission or discount is liable to two years' imprisonment and, in addition, to a fine not exceeding £500.

The League has reason to believe that in many cases this Act is being disobeyed, and recommends employers carefully to note any changes made recently, or which may be made in future, in the placing of their orders, as the reason for such changes may be the refusal of Seedsmen and Nurserymen who strictly observe the law to give any presents to gardeners without the written authority of the employer.

Any information will be gladly afforded by the League. Address, 9, Queen Street Place, London, E.C.

To Rose Lovers.

THE pride of the gardener is undoubtedly the rose. But not all roses are successful, owing to weakly condition and risk in transplanting.
D. & W. Croll, the famous Scotch Rose Specialists, rear roses that for hardiness, strength and bloom cannot be equalled. They transplant without risk, and will withstand the most severe winter. The

LISTS AND ADVICE FREE.

Have YOU yet received

Burpee's

Annual for 1914

which is now being mailed at the rate of more than ten thousand copies every day?

A BRIGHT NEW BOOK OF 182 PAGES, it is known as "THE SILENT SALESMAN" of the World's Largest Mail-Order Seed Trade. It tells only the **plain truth** about the

Burpee-Quality Seeds that Grow

Bound with covers lithographed in nine colors, it shows, with the colored plates (also in nine colors), Six Novelties and Specialties in unequalled Vegetables, and sixteen Beautiful New Flowers, including the most Superb "SPENCERS,"—as grown at BURPEE'S FLORADALE RANCH, the California "Home of Sweet Peas."

With hundreds of illustrations from photographs and carefully written descriptions it is a SAFE GUIDE to success in the garden, and should be consulted by every one who plants seeds, either for pleasure or profit. While it is never sent unsolicited (except to customers of record), we are pleased to mail it FREE to every one who has a garden and asks for it. Shall we mail YOU a copy? If so, kindly mention *The Gardeners' Chronicle* and **write TO-DAY!**

In the past thirty-seven years (since 1876)

The House of Burpee

Has introduced more distinct New Varieties of Vegetables and Flowers that are now in general cultivation than have any three other American firms. Selected Stocks are produced upon our own seed farms in Pennsylvania, New Jersey, and California, while FORDHOOK FARMS are famous as the largest and most complete trial grounds in America. No Government Experimental Station in the world attempts such complete trials each season, and the information here obtained is of incalculable benefit to planters everywhere. We travel more than thirty thousand miles each season to inspect growing crops, and yet never a single mile to solicit an order! We trust, however, that you will read our "SILENT SALESMAN." A postal card will bring it. But please **write TO-DAY,—"Lest You Forget."**

BIRD'S-EYE VIEW OF THE ROYAL SEED ESTABLISHMENT, READING, SHOWING RECENT ADDITION, WITH BRIDGE, IN FOREGROUND.

NOW READY!!!

SUTTON'S New GARDEN SEED CATALOGUE for 1914.

The finest publication of its kind in existence. Contains full descriptive lists of the best Flower and Vegetable Seeds, Seed Potatoes, Lawn Grass Seeds, Horticultural Sundries, etc. The book, which has been greatly enlarged, includes a magnificent portrait of Her Majesty Queen Alexandra, taken at the Chelsea Show, where she graciously accepted a spray of Calceolaria from Mr. Arthur W. Sutton, V.M.H., and also contains many beautiful coloured plates of Flowers and Vegetables with upwards of 300 illustrations in black and white.

SUTTON'S SEEDS have throughout the past year maintained their wonderful reputation for producing high-class prize-winning Flowers and Vegetables, and have now gained no less than 602 Gold, etc., Medals.

DOBBIE'S COLLARETTE DAHLIAS.

A GREAT trial, consisting of between 7,000 and 8,000 plants of Dahlias, was carried out by Mr. Reginald Cory at Duffryn, Cardiff, in conjunction with the Royal Horticultural Society and the National Dahlia Society. All classes and sections of the Dahlia were represented. The following is the official report :—

"The Collarette section was represented by about one hundred and fifty varieties, a formidable list for such a late aspirant to public favour; still, at the date of inspection, they produced the greatest impression, for they were literally masses of flower, due, doubtless, to their free-flowering propensities, shy varieties being quite rare in their ranks. However, only twenty-three varieties were honoured."

Of the twenty-three varieties which received awards as best and most desirable for garden decoration, thirteen are varieties of our raising, proving conclusively that we have the best collection of these New Dahlias in the world.

All interested should send for our 1914 Catalogue, which is now ready. We are offering the most recent Novelties at **1s. 6d.** each, and many of the best varieties of Collarette Dahlias are listed at as low as **6d.** each.

NOTICES.

CAUTION.

THE SECRET COMMISSIONS AND BRIBERY PREVENTION LEAGUE, INCORPORATED, begs to call the attention of employers and gardeners to the fact that under the PREVENTION OF CORRUPTION ACT, 1906, any gardener who corruptly asks for, agrees to accept, or accepts, or any tradesman who offers, agrees to give, or gives any secret commission or discount is liable to two years' imprisonment and, in addition, to a fine not exceeding £500

The League has reason to believe that in many cases this Act is being disobeyed, and recommends employers carefully to note any changes made recently, or which may be made in future, in the placing of their orders, as the reason for such changes may be the refusal of Seedsmen and Nurserymen who strictly observe the law to give any presents to gardeners without the written authority of the employer.

Any information will be gladly afforded by the League. Address, 9, Queen Street Place, London, E.C.

PLANTS, &c., WANTED.

Have YOU yet received

Burpee's

Annual for 1914

which is now being mailed at the rate of more than ten thousand copies every day?

A BRIGHT NEW BOOK OF 182 PAGES, it is known as "THE SILENT SALESMAN" of the World's Largest Mail-Order Seed Trade. It tells only the **plain truth** about the

Burpee-Quality Seeds that Grow

Bound with covers lithographed in nine colors, it shows, with the colored plates (also in nine colors), Six Novelties and Specialties in unequalled Vegetables, and sixteen Beautiful New Flowers, including the most Superb "SPENCERS,"—as grown at BURPEE'S FLORADALE RANCH, the California "Home of Sweet Peas."

With hundreds of illustrations from photographs and carefully written descriptions it is a SAFE GUIDE to success in the garden, and should be consulted by every one who plants seeds, either for pleasure or profit. While it is never sent unsolicited (except to customers of record), we are pleased to mail it FREE to every one who has a garden and asks for it. Shall we mail YOU a copy? If so, kindly mention *The Gardeners' Chronicle* and **write TO-DAY!**

In the past thirty-seven years (since 1876)

The House of Burpee

Has introduced more distinct New Varieties of Vegetables and Flowers that are now in general cultivation than have any three other American firms. Selected Stocks are produced upon our own seed farms in Pennsylvania, New Jersey, and California, while FORDHOOK FARMS are famous as the largest and most complete trial grounds in America. No Government Experimental Station in the world attempts such complete trials each season, and the information here obtained is of incalculable benefit to planters everywhere. We travel more than thirty thousand miles each season to inspect growing crops, and yet never a single mile to solicit an order! We trust, however, that you will read our "SILENT SALESMAN." A postal card will bring it. But please **write TO DAY,—"Lest You Forget."**

CATALOGUE & CULTURAL HINTS GRATIS

XL ALL! XL ALL! XL ALL!

RICHARDS' FUMIGATOR.

AUTUMN IS WITH US!

And Gardeners will be on the alert for Frost.

Plants which have been taken under glass, from the open, would be all the better for a vaporising with **XL ALL Compound,** or a syringing with **XL ALL Liquid Nicotine Insecticide Wash,** whichever method is most suitable and convenient. Mealy Bug and Scale on Vines and Fruit Trees can be speedily stamped out with one or two dressings of **Liquid Nicotine Insecticide.**

Hundreds of gardeners can confirm this statement. **XL ALL** is the best, most largely used, and popular Insecticide of the day.

Will gardeners kindly remember that although these preparations are what are known as poisonous, they can be ordered through any Nurseryman, Seedsman or Florist? Get in supplies with your Bulbs and Seeds! Most gardeners will know that **XL ALL Insecticide** is much more efficacious than the common soapy (non-poisonous) washes now so much advertised.

Prices, particulars, and supplies from Nurserymen, Seedsmen and Florists everywhere.

G. H. RICHARDS (XL ALL),

Largest Manufacturer of Nicotine and other Insecticides in the World,

KILPEST

For Your Garden's Sake

Use "KILPEST" and give your plants every opportunity to thrive. "KILPEST" exterminates black and green fly, red spider, thrip, gooseberry caterpillar, mildew and aphis pests, etc., on plants, flowers, or foliage. It cannot harm anything but insect life, and the most delicate plant cannot be injured by its use—it is absolutely non-poisonous. As a winter dressing "KILPEST" is invaluable for vines, peach and fruit trees of all kinds. Get a supply from your dealer to-day.

Prices: Pint **1/6**; Quart **2/9**; Half-gallon **5/-**; Gallon **8/-**.

PRIVATE.

MR. E. STEELE wishes to thank all applicants for Gardener and Caretaker's place, which is now filled.

POLICE RECRUITS are required for the Shanghai Municipal Police.

Applicants must be unmarried, of good physique, with sound teeth, about 22 to 26 years of age, about 5ft. 10in. in height, chest about 38in. fully expanded, and able to furnish excellent references as to character.

Salary commences at Taels 70 per month, equal to about £9; the value of the Tael at present rate of exchange is about 2s. 8d., but it is liable to fluctuation. Men in the Army and Navy, or Reserve, must obtain their full discharge before enlistment.

Liberal superannuation scheme and good prospects of promotion.

Particulars will not be forwarded to applicants unless they clearly state that they are able to comply with the above requirements.—Apply by letter, in envelope marked "Police," to Messrs. JOHN POOK & CO., agents for the Municipal Council of Shanghai, 68, Fenchurch Street, London, E.C. November, 1913.

GULVAL (Penzance).—County Council Experimental Fruit and Vegetable Plot. Applications are invited for the post of GARDENER, to take charge of the above plot. Preference will be given to a thoroughly skilled Gardener, who has had a first-class experience in early Vegetable and Fruit Culture, and has a good knowledge of the use and advantages of Frames and Handlights; wages 35s. per week. Applications, stating age and experience, and accompanied by recent testimonials, should reach the undersigned on or before Tuesday, January 13, 1914.—E. C. HARVEY, District Education Office, Penzance.

WANTED, FOREMAN or good FIRST JOURNEYMAN to take charge of Fruit and Plant Houses; no Bothy.—State wages required to J. TEASDALE, Down Place Gardens, Guildford.

WANTED, good JOURNEYMAN, for Fruit and Plant Houses, etc., under Foreman; 17s. and Bothy.—Age and copies of references, to J. A. COOK, Chilworth Manor Gardens, Romsey, Hants.

WANTED, Good JOURNEYMAN, for Inside; wages 17s., Bothy, etc.—Apply, S. WATHEN, The Gardens, Berkeley Castle, Glos.

WANTED, Strong, Active YOUNG MAN, principally for Fruit and Plant Houses; wages 21s.; no Bothy.—Apply, B. LUCKING, The Gardens, The Grotto, Basildon, Reading.

TRADE.

WANTED, MANAGER and TRAVELLING SALESMAN; first-class Man with general knowledge of Plants, especially Orchids; honest, temperate, and up-to-date business Man.—Apply, with full particulars (which will be confidential); good chance for a bright Man.—HORTUS, Box 3, 41, Wellington Street, Covent Garden, W.C.
